Does MFJ actually make anything at all that works? I bought one of
their MFJ-462B Multi-Readers at a hamfest recently and have found it
totally unable to copy any signals of any sort, even nice slow CW
that is 5-9. My only previous experience with them was with a QRP
rig that was about as effective.

I have for sale the cabinet from a Hammarlund HQ-140 receiver which could be used for several other models or types of receivers. It is in good shape but could use a repainting if you are particular. However, it is still presentable. Has two strong handles on the sides and a lid on top for access. The front opening is 18" wide by 10" high by 12" deep. I will pack it carefully. Asking $45 plus shipping. Thank you for looking.

QTH.net is an e-mail reflector with a bunch of lists pertaining to
various amateur radio special interests. You signup to the lists you
like for free. All e-mails sent to a list are automatically forwarded
to all subscribers of that list. Each list has a volunteer moderator.
It takes computer resources and somebody's time to maintain. There are
some reflectors out there that are not free.

The big advantage is that you don't get spam and don't get wacky posts
from occasional oddballs. Also flame wars are virtually non-existent
because the moderator kills those messages early. The result is a lot
like the Forum - very civilized and kinda boring for some compared to
regular Usenet newsgroups.

Reflectors sometimes have web sites with archived messages that can be
searched. You wont see the old messages with a Google search though.

In the late '70's I bought an MFJ audio c.w. filter.
It didn't work, so I opened the minibox and found that
the p.c. board was not mounted with any hardware:
they had merely glued it in at a 45 degree angle.
I threw out the filter, and stopped looking at MFJ ads.

What you paid is your own problem. The issue is whether the radio was
described as complete, parts, fixable, guarenteed dead, incomplete,
or whatever.

I bought an SB-303 that was a near-empty hulk on eBay. I paid US$65
for it and it was missing ALL the under chassis boards. The ad was
slightly deceiving as it did not disclose that fact.

I didn't have a complaint as the ad said "Parts Radio", showed the top
of the chassis and I'll harvest my money's worth from the radio
including the 400 cycle CW filter, cabinet, back panel, LMO, SSB
filter, etc.

> I attempted to contact them and they avoided me for a couple of days. When

> and correct the situation in any way.

Again, was the radio described as "incomplete"? If not, then you do
have a complaint. I believe that to be called a radio, it should have
all the parts there. A knob or tube might be missing, a few components
might be bad but it should power up and make a noise. Otherwise, they
must call it something other than a radio.

Fair terms might be, "Junker", "Parts-only", "you get what you see", or
other warning that it's more than a bad fuse, bad PS cap, etc.

2482. Heath SB-100 VFO fix?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-10-02 14:36:57 UTC
From: George Gonzalez <grg2@attbi.com>
Message-ID: <dwDm9.13186$DN4.3002@sccrnsc01>
Source record: 38155

I'm restoring a SB-100. No major problems, onmce I got all the weak
tubes and intermittents out of it.

But now it's time to fix the VFO.. The kob/reduction drive slips badly.

It would
probably respond to your basic clean-destick, relube regimen,
but that probably means removing the front panel. I can do that,
but if anybody knows os a shortcut, I sure would like to hear it!

Regards,

George

Take the front panel off, it'll take about 15 minutes but will make the clean up and mechanical alignment much easier.

The problem with prying off the bezel is that you might bend the pinch rollers that move the hairline. I can do it but you take a chance everytime you short cut the disassembly.

That said. you might not have to do that. If the LMO drive is just slipping, you might loosen the retaining nut, keep the drive engaged and press straight down to increase the grip. Tighten the nut while pressing down.

If the drive is clean, that might be enough to get it working again.

Good luck to you.

> clean up and mechanical alignment much easier.

Thanks, I did take off the panel, it wasnt as bad as I thought.

It turns out the two phosphor-bronze pinch washers on the
tuning shaft were cracked, AND the reduction worm gear
inside the VFO was very dry, AND the preloaded main
gears were stuck together.

With a little fudging I got the pinch washers to pinch again.
The dry VFO gears were hard to get to, but if you peel off
some aluminum tape on the front of the box, you can slowly
feed in some grease to the main gear, which will transfer
soem grease to the worm gear if you turn the main drive
back and forth. After about 20 passes, I got enough grease
in there to loosen it up considerably. The stuck-together
main gears just needed some oil and exercise.

Getting it all back together took a while, but it finally
came together and now runs quite smoothly.
Took about 2.5 hours, worth it I guess as the radio was
useless otherwise.

Regards,

George

> The Ebay Transaction number was 1375531710 Please take a look for yourself
> and see if it was honest. Don

Based on their ad and what you say, I would not buy anything from them.

What are these 9 missing boards? Are they part of the base radio? The
SB-303, albeit a simple analog box only has:

0. the small mother board.
1. RTTY board
2. Mixer board
3. Antenna
4. RF amp
5. Heterodyne osc
6. Crystal
7. BFO, IF, Audio
8. PS, calibrator
9. the LMO

Their ad implies that you would get a complete but untested radio.
You don't have to test a radio to notice that many circuit boards are
missing.

The "parts" SB-303 that I bought only had boards 0, 1, 2, and 9 in it.
I only paid $65 and got a 400 cycle CW filter (which is working in
another SB-303). If I put a value of $45 on the CW filter which I
wanted, the rest of the radio was only $20.

I needed an SB-303 cabinet. I needed the pointer follower for an
SB-102. I have another SB-303 with a massive hole in the back panel.
Now I have a good back panel. I got about $100 worth of parts out of
the $65 radio. I kinda wish the seller had disclosed that there
weren't any boards in the bottom but, oh well, live and learn.

One thing that eBay sellers don't realize is that many people look for
"parts" radios and "guarenteed dead". I've been in bidding wars for
such radios that have gotten out of hand.

I bid a "guarenteed dead, has some weird mods in it" SB-303 way up.
This turned out to be an excellent buy as I was able to fix it and the
mods are a RTTY board and high impedence output. This is the radio
with the big hole in the back panel.

I plan to restore it to showroom condition next year.

Its worth the effort, those SB-100 and 101's (with the exception of the grease problem) have good LMO's
Those flimsy solid state LMO's in the SB-102's were the pits, every one I seen suffered from mechanical stress and loose trimmers.
Just tapping them sent them jumping at least 300 Hz.
Since the radio is open note:
If you have a hum during receive disconnect the harness and run a shielded wire from the volume control to the audio board. (same points)

2501. OT: Need assistantce ID'ing early CB HTs and locating schematic

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-10-03 06:42:08 UTC
From: Will White <googlyelmo@earthlink.net>
Message-ID: <3D9BE705.1C798BDB@earthlink.net>
Source record: 38173

I found a pair of Sears-branded single channel 100 mW CB walkie talkies at a local thrift shop for $3 for the pair. They are in *beautiful* working shape, with black wrinkle metal case and chromed die-cast fronts, and even a snazzy little analog battery level indicator, and a very well-designed adjustable wrist strap. Not a scratch, chip, rub, dent, or spot of rust on them!

They have also an earphone jack, off course a PTT switch, and on on-off-volume pot, and run off standard 9-V batteries. They look almost new, and of sufficiently high quality they were probably marketed back in 65 to CB hobbyists/utility users rather than to kids.

Now, while they do work fairly well (crystalled for Channel 11 as I received them). They could use an alignment, and the audio section of one of them at least needs new caps, and probably the PS needs caps as well. They each transmit and receive, but with lots of noise (no squelch circuit?), and one of the pair has low audio and a good deal of distortion, as well as picking up faintly a local AM BCB station sometimes. All the info I can furnish is as follows below:

*Labelled as Sears-brand
*Says "9 Transistor" below speaker-mike on front
*Marked on back "chassis #. 787.10001"
*Also on back ""service # 787-645000"
*Has old version of Part 15 warning on back (the one that mentions antenna length and power *input* and crystal tolerance (0.005%!)
*Manufacture Date May, 1965
*stamps both on the back and inside the chassis indicate these units were made in Japan.
*most transistors are marked "Toshiba", with a couple as 2SB56, 2SA74, 2SA92

I would be grateful to anyone who can probide me with any help or guidance in identifying these walkie-talkies, expecially in determining who the manufacturer was. I would be happy to pay reseaonable costs if anyone could provide me with a schematic, from Rider or Sams or some similar source. If you can only refer me to an expert in tracingin/IDing old CBs.

I'd like to put these back in original working condition. All advice, directions, suggestions, comments, and referrals very graciously accepted! Thanks!

> circuit?
>picking up faintly a local AM BCB station

Most of those older "toy 100MW" units were xtal for transmit and
regenerative receive.
How many crystals do you see inside, ill bet one.
If so an alignment wont help much, no IF's
BTW those sound like 60's Lloyds Electronics...yes they look real cool.
some had a red CW key and a chart on the front.

2507. Bringing up older radio

Date: 2002-10-03 14:06:30 UTC
From: Chuck/KE4ETH <chuck_hawks@hotmailnospamorama.com>
Message-ID: <NXXm9.11368$OM4.6058707@e3500-atl1.usenetserver.com>
Source record: 38180

I am getting a Henry Tempo One this weekend. It hasn't been used for about 4 years. I know that the best thing to do is to bring the voltage up slowly with a variac, but I don't have one and don't have ready access to one. Any ideas on how to bring it up so as to keep the inrush of current/voltage on the electrolytic caps low to (hopefully) recondition them?

Thanks in advance

Yep...here is a old trick. Put a standard 100w light bulb in series with
the AC line to the rig.

Here is a long list of what I have for sale..would like to sell it all to someone and they pick it up..:
sp-400 and p/s
sp-200 and p/s
sx-28
rca ar-88
hro jr with all coils
ht-32
globe modulaters
hq-120
s-42 speaker
sx-25
regan ss recieve
rhro 51st reciever with all coils
miltary recievers
test equipment
10-15 boxes of meters lots new
10-15 boxes of tubes
8- 813 transmit tubes
hro and other National dials.
.newroller inducters
air caps
caps of all types
much more..my guess is around 2500-3000 dollars worth of stuff. if you are interesed lets talk..need my garage back..

Put two 60 watt lightbulbs in series with the AC power.
When you first turn the rig on, they will glow brightly.
Soon they will dim down some. When they stop getting dimmer
and stay at a particular brightness, substitue two 100 watt bulbs,
then cut down to one 100 watt bulb. If the rig isn't coming up
by now and the lamps are staying brighter, then there is a short
in the power supply you'll need to find.

2512. Frustrrating Heath Service bulletins !!!!

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-10-03 17:04:48 UTC
From: George Gonzalez <grg2@attbi.com>
Message-ID: <PM_m9.26803$xl5.5263@sccrnsc02>
Source record: 38185
Cross-posted to: rec.radio.amateur.boatanchors,sci.electronics.repair

I'm looking thru the Heath Service Bulletins for the SB-100.
** I Want To Scream **

There are titles like: "6146B tubes don't work",
"Westinghouse 6AU6's don't work".

It seems that the SB-100 allegedly isnt too tolerant
of tube variations. I havent verified this myself,
but Heath was convinced enough to put out service bulletins
about this situation. What's really frustrating is they don't
say WHY the SB-100 is so picky, and they offer no
solutions to the problem, other than sticking with certain
tube brands and suffixes.

The engineer in me doesnt like the idea of a design being so
critical, surely something can be done.

Does anybody know what the problems are, and
suggest a fix? Is it a case of parasitic oscillations,
due to the 6AU6's being run flat out at 300V B+?
What's wrong with 6146B's?

Any ideas appreciated,

George

These are the last remnants of a garage salvage operation that took place almost a decade ago. These items belong to a long passed chief engineer named Johan DeVaio at WLYN, an AM Broadcast station in Lynn, Massachusetts. His son was about to leave hundreds of pounds of vintage gear for the garbage men before we scooped it up. The Calrad VU meter still has the Radio Shack sales receipt from 1967. The vintage and frequency range of the switch attenuator is unknown but it has BNC connectors on it. Probably good for audio through HF. Manufacturer unknown but it is serialzed 12736 and inspected by inspector #2.

Not only the SB-100
All of them with that chassis from the HW-100 to the SB-102.
Just make sure the shield on the 6CL6 driver tube is in place and well grounded, its best to silver solder some braid and not rely in the clip and the neutralization trimmer properly set.

> What's wrong with 6146B's?
Never seen a problem there, I dont know what they are talking about.
Most I seen is they sure dont like Westinghouse driver tubes (6CL6) "low drive"

> There are titles like: "6146B tubes don't work",
> "Westinghouse 6AU6's don't work".

Depending n the batch*
The engineers built them to use "tuff" Tungsols and Mullards in IEC labeled boxes, the 6AU6's run hot for low grade Japanese manufactured tubes. (bad tolerances, S meter won zero etc)
At the time many American branded tubes started being manufactured in Japan

Hopefully you have told eBay about your experience. You can at least
give the dealer a black mark on eBay which will hopefully warn other
potential customers. And enough black marks can even ban them from eBay.

"This is one hot receiver - well, it's deaf from 8 to
18 Mhz, and is one fine receiver. Totally original
and unmodified, 'cepin for the hole cut in the side
where a plug or somptin has been put. And she's
ONE HOT RECEIVER! By golly I heard a
signal on it. It gotses a buzz of some kind that
sorta plays from 8 to 18 mhz, but man o man,
this is ONE HOT RECEIVER. Did I mention
how hot it is? Dang! And no reserve. Yep -
the bidding starts at only $300 bux and you can
buy your own batteries."

The 6146B has a little higher gp capacitance and the neutralization
circuit may not have enough
range to neutralize properly. Some of the Collins radios are
particular about this. I have had to
change the value of the neutralization coupling cap in some to get
them to neutralize properly.
Also If I remember, the B has a little different screen voltage
requirement. But they will work
fine.

I agree with the good ground on the 6CL6 driver shield. Also the
grounds on the coil shield
covers under the chassis must be very good or the final will be
squarely. Tightening the through
chassis mounting bolts for the shields often helps a bunch.

The SB100 needed some changes in components in the receiver front end.
It was not as hot as
the later SB101.

wow, that's a lot of missing stuff.

Can't see how they can call it a radio if it's missing all that. It
sounds like it's a case and "many good parts in this one, could be used
to restore or repair another."

Give them negative feedback. They deserve it.

I'm looking for a B&W 40m BVL coil.

4 in-line pins, two separate coils and enough of a
gap to allow a swinging link, about the same size, to
pass between.

Anyone have a 40m BVL coil?

anyone have a BVL jackbar so I can wind my own
40m coil?

FOR SALE:

Two James Millen adjustable coils on ceramic forms.
Type 69045 Dimensions 2-1/8" long X 1/2" diameter.
Single hole mounting, solder terminals.
QTY 2 available for $4.00 each
http://home.cfl.rr.com/happysurfer/imag/two_james.jpg

3 turn link with two tube plate caps attached.
Ideal for homebrewing.
Bakelite swinging arm for coupler. Pivot goes to ceramic "BVL" Jack
bar
with 4
metal jack sockets, and pivot brackets that are wired to two large
plate
caps made
for tubes with 1/2" diameter plate cap. Part of a BVL tank system.
Has enameled copper wire and some very useful hardware attached.
Link coil dimensions 2-1/2" diameter. Enamelled 18 gauge copper wire.
QTY 1 only at $5.00
http://home.cfl.rr.com/happysurfer/imag/3turn_link.jpg

6 turn air wound coil - airdux style. Dimensions 3/4" long X
2" diameter. Inductance 2.2 uH.
One only - available for $3.00
http://home.cfl.rr.com/happysurfer/imag/6turn_air_wound_coil.jpg

18 turn coil. Airdux style. 1.75" long and 2" diameter. 10 TPI.
12.2 uH. Will sell for $5.00
Similar to above coil only longer. Picture available.

30 turn air core coil. Dimensions are 4" long and 2" in diameter.
Inductance is 18 uH. QTY 1 only at $6.00
http://home.cfl.rr.com/happysurfer/imag/30turn_air_core.jpg

48 turn air core coil - airdux style. Has Dimensions 7" long X 2"
diameter.
Inductance is 29 uH. QTY 1 only available for $10.00
http://home.cfl.rr.com/happysurfer/imag/48_turn_air_core.jpg

91 turn air core coil - Measures 6.5" in length and 1.5" diameter. 14
turns per inch.
65 uH inductance. Excellent with plexiglas support and four mounting
holes. QTY 1 only for $12.00
http://home.cfl.rr.com/happysurfer/imag/91turn_air_core_coil.jpg

Ceramic coil, split off-center. Has total of 20 turns with a
tap at 13 turns.
On white ceramic form - former dimensions 3" long X 1.5" diameter.
Coil length is 2". Inductance is 8.56 uH.
Qty 1 only for $3.00
http://home.cfl.rr.com/happysurfer/imag/ceramic_coil_split.jpg

Ceramic coil with approx 110 turns of green cotton covered wire.
White ceramic form has dimensions - 2" long X 1.5" diameter.
Inductance is around 330 uH. Suitable for AM band or LF applications.
Has screw terminals and solder lugs for connection.
New old stock. QTY 1 only for $4.00
http://home.cfl.rr.com/happysurfer/imag/ceramic_coil_with.jpg

Coil form, ribbed white ceramic. Dimensions are 5" long and
2" diameter.
Ribbed style with slots for wire. Designed to hold 26 turns and
would have about 20 uH. Has 4 mounting holes on each end.
Has been repaired; looks fine, hence low price.
Qty 1 only at $1.00
http://home.cfl.rr.com/happysurfer/imag/coil_form_ribbed.jpg

Coil form - odd design ribbed ceramic former with 6 terminals on
base and three nice threaded holes for mounting screws.
Dimensions are 2-1/2" tall X 1-1/8" diameter.
Inner coupling coil is 7/8" diameter with tapped coil of enamelled
wire brought out to three terminals.
Qty 1 available for $3.00
http://home.cfl.rr.com/happysurfer/imag/coil_form_odd.jpg

Multi-tapped coil. Unique design attached to a PC board with a tap
for every turn.
Airdux type air core form. Coil has a total of 32 turns and dimensions
of
4" long X
1.5" diameter. Approx 12.5 uH.
QTY 1 available for $6.00
http://home.cfl.rr.com/happysurfer/imag/Multi-tapped_coil.jpg

14 MHz plug-in tank coil with link coupling. 20m coil on 5-pin base.
Marked as model 2420. Medium size. Airdux style coil has 11 turns
and the link outside it has 3 turns. QTY 1 only for $5.00
http://home.cfl.rr.com/happysurfer/imag/plug_in_coil_with_link.jpg

AC AMPERES 0-1.5 SIMPSON 2 1/2" SQUARE $10.00

NOTE ALL IN GOOD SHAPE , All deflect and work fine.
All prices include shipping.

I have pictures of the meters.

Really nice capacitor bank with board and eq resistors already
mounted.
It has the screw type filter capacitors. They are mounted on a
commercial made PC board with eq. resistors. It consist of 15 -
1500mfd @ 450vdc
computer grade capacitors in series. There is room for one more cap,
of
which I have a couple of spares 17 total caps. There are also some
extra resistors mounted on the board you could use to add the last

one.
That would give 93 mf at 7200wvdc. That is nothing to sneeze at! Most of the HARD work is already done for you.
Great for your next high powered project. It will fit in a standard 19" rackmount chassis it is 6" tall 9 3/4" depth
Figure about 25lbs packed weight shipped from 28681 would like 100.00 + shipping open to offers

If it's part of the Windows system, it's a virus. I strongly recommend deleting the entire Windows system and installing an operating system that actually works.

Hi fellow anchormen,

I've recently received a plate transformer purchased on eBay. The ratings are: Pri 115v, Sec 4700 vct 300ma. (There are no filament or control windings).

On measuring the primary's dc resistance with a VOM, the reading is 7 ohm. Is that normal, or is it a short?

TIA
Ron

It could be either one. DC resistance doesn't tell you anything. You can
have one shorted turn and the impedance at 60 Hz will drop to nothing and
make the transformer useless, but the resistance won't change.

What you want to know is the effective impedance at 60 Hz, which you can get
by putting the transformer across the power line with an ammeter in series,
then calculating the voltage drop across the transformer. Another trick is
to put it across the AC line with a 60W lamp in series and see how brightly
the lamp goes with no load on the transformer secondary.

Source record: 38028

DC resistance of transformer windings only tells you if the windings are open circuited. Transformer's respond to AC, and as such, its winding's IMPEDANCE will always be higher than the DC resistance.

For a 4700V x .3A = 1410 Watt transformer, I would expect the DC resistance to be very close to zero. You probably aren't using your VOM properly in measuring such a low DC resistance.

For instance, if the resistance of the primary winding really was 7 ohm, the winding loss in the primary at full output would be:

P = I x I x R = (1410 Watt/115 v) x (1410Watt/115v) x 7 ohm = 1052 watts!

Not very likely.

Ron, man to man here, are you sure you are qualified to be messing with a transformer this size? This puppy will kill you without even working up a sweat. I'm not just being super cautious here, I really mean it.

If you don't really, REALLY know what you are doing working with voltages and currents like this, do your family a favor, and put this beast away until you do.

73,

Chuck Harris - WA3UQV

2561. FS: BC-312/342 parts

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-10-04 21:44:20 UTC
From: "D. S. Platt" <jeepp@erols.com>
Message-ID: <3D9E0BB4.8FAD1BBB@erols.com>
Source record: 38034

I have the following BC-312/342 parts, listed below. I bought what appeared to be a pristine BC-312. Well... it looked perfect, but someone had decided to rewire it and convert it to miniature tubes, etc. They got part way through and gave up, I guess. Fellow who sold it to me said "it works great"..... so much for hamfest integrity... didn't used to be that way. Sooo, its been carefully disassembled to glean some parts to make an equally nice '342 work (bezel, p.s., etc., etc.). Maybe I can amortize part of my "investment??? Hi !!

1st DET Trans. module w/ crystal filter (and shaft) $18 (BC-342)
2nd RF module $18
1st DET module $18
1st RF module $18
1st IF Trans. $8

2nd IF Trans. $8
Mixer module $18
Case (quite nice) $18
BC-312 Front Panel* $18
"BC-312-M" "RCA" original brass name plate (exc). $20
all negotiable....

* Its in superb condition, with the fast-tune shaft and gear, idler gear, and plate included. Also antenna, Alt antenna, gnd push-posts, and all locks. BUT, its a real bear to change out!! Not for the un-trained or weak-at-heart!! I don't think I'd care to try it.... Continuing, this panel has dial-light marking (vice crystal phasing). No elephant trunk, nor toilet seat covers, etc., however. This panel will work for either the 312 or the 342. The difference is the collocated dial light or crystal phasing marking. The fellow who was re-building this unit installed a BC-342 transformer w/ phasing and brought the shaft out the dial light pot mounting hole. Hole alignment is identical.

BTW: I'm looking for TCS cables and connectors.....

Thanks for looking. I am looking for a manual, schematic or any other info on my Harris (RF Communications) RE 6001 mobile repeater. The boards inside the unit were made by Public Systems of Sunnyvale California. From the code dates on the components it looks to be made in 1977-1978 time frame. It is also currently on 153.83 Mhz. I would like to recycle the receiver and transmitter boards for another purpose.

Source record: 38061

I've been thinking about a scruffy Scott RBO-2 receiver I saw recently-it's been well used and has been sitting in storage for at least 30 years. It obviously doesn't work, and I have no idea of what power it needs or what sort of speaker to use. How are theses things to restore, and how well do they work as shortwave receivers? Is this a good example of the famous E.H. Scott quality? I'm fairly new at both electronics restoration and shortwave, so any information at all would be appreciated! I've poked around on the web and have not found much beyond some photos and a manual. Thanks in advance, Andrew

Hmmmm....ok. In fast, D3 is bypassed by the switch. Do you have any idea what the FLA might be? I don't suspect very much given the physical size of the transformer.

I would imagine it's pretty low. Manual says #20 (AWG) is ample for a length
up to 125 feet.
FWIW, it's a nice little rotor. Mine's been turning a Mosley TA-33-M for
over
10 years with no problems.

2607. FT-480R repair, help needed

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-10-06 18:29:49 UTC
From: Richard J <nospam@mah.se>
Message-ID: <anpvea$e5q$1@news.lth.se>
Source record: 38080

Hi group -

just started up an old FT480R 2m allmode, Eu version.

The display shows 445000.0 and nothing happens when dial is turned.
There's life in the box -RX has hiss, squelch and all modes seem to work,
dunno if TX works, but it goes into TX mode, so I thought it might be nice
to save it/fix it. AFter all, it's a multimode.

Have schematics and adjustment handbook. Adjustments all require that you
tune to this or that frequency to read voltage in PLL unit testpoints (for
example). Problem is, I can't tune - at least it doesn't look like it.

Any ideas on what to do, where to look next? Is this a display driver
problem, a PLL/VCO problem or a tuning decoder/whatever problem.

Beats me where to start. Haven't done much repair of stuff in my ham
life...but have decent range of instruments, incl scope and VTVM. No
frequency counter tho, but can borrow.

I bet someone out there had the same problem. I remember the IC211 for
having typical faults in PLL unit....is this the same story?

Advice appreciated. TIA for your time, guys.

73 /Rick, SM7SCJ

>
> On measuring the primary's dc resistance with a VOM, the reading is 7 ohm. Is
> that normal, or is it a short?

grab a variac, set it to 0v, and clip your meter to the secondary. Make
measurements.

for safty's sake, I'd only go to about 50v on the primary, if you can get that
far
before something starts to draw current. if possible, monitor the current being
passed through the variac. Start at 10, then 20, then 30 then 40vAC input, and
measure the output. at the very least, you'll know what the turns ratio is, and
since you already know the DC resistance of the secondary, other calculations
should prove easy.

Source record: 37955

Hello goup,

I found a signal generator I-96-a (maybe T-96-a).

Who can help me with a manual/circuit diagram or any other info??

It has 2 nameplates.

First one is black It reads among others
US Army Signal Corps
Bendix radio
signal ganerator I-96-a

The second one is red
signal generator
Ref. 110s/19
A (crown) M

So it was used by the Brittish Air ministery.
It has a few sockets for british coax plugs.

So probably it was made for (customized by) the RAF.

The frequency range suggests that it was used for the SCR 522 (BC
624/BC625).
Or its equivalent TR1143.

The large wooden case has a -Battery compartiment
-Mains power compartiment
-Phantom antenna
-IF signal generator
12.014Mhz
-HF signal generator Master
Oscilator or x-tal

regards,
regards,

Pieter Lamers PA3HDU

Hi Dean, and others,
I have a few suitable feet still available, and listed in the Drake
databaseat:
http://www.zerobeat.net/drakelist/database.html
under "feet"
I may be able to get more.
they are not exact originals, but:
Same dim. as on 4-lines & TR-3/4's. Plastic, slightly soft feel, not shiny,
but "flat black". 5/8" tall, tapered 15/16" to 3/4", have hole for #10
screw, not threaded. #10 or #8 nut will press into the recessed bottom.
Metal flanged insert that fits tightly into the hole, to pass #8 screw. Use
either a #10 or #8 screw & nut, supply your own. The std #10's are not long
enough to re-use. $.50/foot, plus shipping of $1.00 for the first 4, + $.25
for ea addl 4
personal checks accepted.
73,
Al Parker, W8UT
204 River Bluffs Dr.
New Bern, NC 28560

How about "audio" as applied to HV rectifier tubes (seen that), or
just "audio" in general?

Anybody have ideas or opinions about converting the 5r4gy rectifier tubes to solid state diodes in my Heathkit DX100b??? Not to worried about keeping it stock as it has many modifications already performed on it. This method was suggested to me as I was searching for replacement 5r4gy tubes. Sounded interesting to say the least. Has anyone out there in " Boat-Anchorvilledom" done such a conversion and if so what were the results??? Thanks in advance. 73' DE aa8wl Sam

>5r4gy tubes.

Easiest thing to do is to make up a couple of diode strings mounted in old tube bases. That way, you can still use 5R4s if desired.

You'll need diodes that can handle at least as much as the 5R4s did. Those tubes are rated 2800 PIV at 650 mA (peak), so you want at least 3000 PIV at an amp or more. You might want to take a close look at the filter caps, because the HV will be higher using silicon. There were commercially-made plug-in SS replacements made for the 5R4, btw - they show up on eBay sometimes.

Another idea is to add a separate filament transformer for the HV rectifiers and convert to 866As, 3B28s, 3B25s, or 1616s. I think 836s might work, too.

5R4s aren't that rare - I've got several, if you want some. Used, but tested on an I-177. Cheap, too.

One thing I would do to a DX-100, Viking 2, Valiant or any other BA rig with several power transformers is to add extra fuses in the 110 volt wiring - one fuse for each power transformer. Keep the existing main fuse. This change is needed because the main fuse must be sized to handle the demand of the entire rig, and an overload on one of the transformers may not blow the main fuse. Example: if the LV transformer gets overloaded while receiving, (such as if the filter cap goes shorted) it may not draw enough to blow the main fuse, yet the overload may burn out the LV transformer. By the time you smell something, it's too late.

I just wanted to remind everyone that it's just over
two weeks until the CC-AWA Fall Swap Meet at City Lake Park
in Jamestown/Greensboro, NC, on Saturday October 26th.

You can find details and driving directions by visiting
the Fall Swap Meet web page at,
http://cc_awa.homestead.com/Fall.html

As always with our swap/mini meets it takes place on
Saturday morning, it starts early 7-8AM, and ends early,
before noon, and admission is always F R E E ! ! !

Do yourself a favor so you won't be disapointed,
get out of bed and get there early, don't bother showing up
at 10 or 11 o'clock, because all you'll get to see is folks
starting to pack up all the good stuff they bought eariler
in the morning.

This is without a doubt the biggest of our swap/mini meets,
DON'T MISS IT.

I'll see you there, early.

Ron

>not sure if they ground properly.

Find an old piece of "war-surplus junque" at a hamfest and look inside.

Just last evening an older ham friend unloaded some "junque" on me, and one part of it was a receiver/transmitter (plus power supply, mike, and some cables) that was about as grungy on the outside as could be, but when I pulled them from their rubber-sealed cases, they were like brand new on the inside, INcluding a schematic printed on a piece of rolled-up silk!

It has TWENTY SEVEN twist-lock tube shields with springs!

Unfortunately, the ID label on the R/X unit is partially obliterated, and all I can read is:
????????? S Army
Rec-Tr ????
Serial No. 18225
Order No ...
Made by The Magnavox Company
for Federal Tel & Radio ???
but the PS is a PP-112/?G, the R/T appear to cover 38-54 MHz FM, the final is a 2E24, and the schematic says "Receiver - Transmitter RT-??/GRC" (the "??" may be "86" or "68" or "66" or "88" or "82" or ????; silk isn't quite paper!). I wish I could learn more about it.

What model?

I gather it's a Trans-Oceanic if it has a wave magnet on the top, but there
are hundreds of variants on the Trans-Oceanic.

Most have B batteries available.

2666. FS: Heathkit Warrior Amp

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-10-08 22:08:23 UTC
From: Ron Eisenbrey <ab5wg@mylinuxisp.com>
Message-ID: <3da356c6$1@news3.mylinuxisp.com>
Source record: 37989

I have a Heathkit Warrior amp that is up for adoption. I have run out of room in the radio shack. This Warrior is in EXCELLENT condition. It has not been modified or abused that I can tell. The cabinet has been professionally refinished and is a perfect match to the original. This is an original Warrior cabinet, no hinged lid on top. Nice chrome knob set, excellent panel, original meter. It is too heavy to ship, pickup only in Houston, TX area. Will deliver within 100 miles. Original manual comes with the amp. $400. If interested please send me an email.

Thanks,

Ron, AB5WG

2667. FA: Heathkit SB-110 & HP-23A 6-Meter Tube Station on Ebay

Newsgroup: rec.radio.amateur.boatanchors

Here's your chance - complete and rare Heathkit SB-110A station
on Ebay. Extremely nice physical condition - SB-110 cabinet paint
and faceplate are mint. Easily could be a collector's unit.

Thanks for looking.

2669. Updated! Free Allied SX/AX-190 receiver info file

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-10-09 02:13:24 UTC
From: Mark Rehorst <rehorstmark@netscape.net>
Message-ID: <9r37qu89l14h0gl6r9skjte5m3130k1ea8@4ax.com>
Source record: 37992

Updated as of 10/7/02!

You can download a ton of Allied SX/AX-190 receiver information
in a single, 2.2 MB .pdf file here:

http://home.attbi.com/~akikoi/wsb/Allied-SX-190-Info-Oct02.pdf

The file includes:
Allied Radio Shack Service Manual
Allied Radio Shack Owner's Manual
Ad from CQ magazine, May 1972
Ad from Radio Shack catalog
Review from 73 magazine
NASWA review by Ed Shaw
QST magazine modifications
CQ magazine mods, March 1973, by Bruce Mackey
Bandswitch mods by John Kolb
NASWA-FRENDX mods by Ed Shaw, May 1974
Comprehensive Technical Manual by Ed Shaw
Getting Reacquainted with the SX-190 by Ed Shaw, 4/77
Allied SX-190 Revisited, by Ed Shaw, 6/82

Thanks to Bob Bachus for converting everything to .pdf format!

If anyone has cleaner copies or additional info, I'd like to add
it to my collection. Please email.

Thanks!

2670. FS: Hammarlund HQ-140X, Works great

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-10-09 03:06:28 UTC
From: maritimus49@aol.com
Message-ID: <20021008230628.17026.00000231@mb-fd.aol.com>
Source record: 37993

I have for sale a classic Hammarlund HQ-140X which I have been doing some restoration work on. Complete cleanup including removing the front panel to clean the dials, checking the circuitry, testing all the tubes and replacing three. Enjoy the feel of large knobs on flywheels. Very sensitive on all bands. Can receive SSB. Audio is beautiful coming from a 6V6 audio amp. Makes for very pleasant program listening. Listening to the BBC on 25 meters right now. Sounds like a local. General coverage with amateur bandspread on 80-10. This receiver is rated 5 stars on DXing.com. Comes with complete copy of the manual and the original case which is undamaged. The case has handles on the sides and a lift-up lid. I am asking $175 plus shipping. Please email me for a photo. Thanks for looking.

73,
Bruce K6RQR

2674. Kenwood TS940 SAT

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-10-09 08:32:44 UTC
From: ljl160@aol.com
Message-ID: <20021009043244.06221.00000290@mb-mt.aol.com>
Source record: 37847

I have a one owner TS940SAT in like new condition. It has the automatic antenna a tuner, cw filter, owners manual, and an MC85 matching microphone with 2 cables. It comes from the shack of a local older ham who is gonna move to smaller housing or an assisted living type situation. Hes a non smoker and the rig sat in his nice shack since new. It has not seen hard use either. I have it now in my shack and Ive run it through its operations--- very nice. So if you are looking for a premium shape 940-this is it. Asking $900.00 plus shipping. Thanks-Lew KlNDV

2675. FS: Collins 75A-4 / KWS-1

Message-ID: <20021009092910.23203.00000735@mb-fp.aol.com>
Source record: 37848

For Sale: Pristine collector condition Collins 75A-4 / KWS-1 combination, better known as the "Gold Dust Twins." The 75A-4 receiver is a Howard Mills restoration complete with the 4:1 knob, and four plug in filters: 3.1Khz std., 2.1Khz narrow SSB, 800Hz CW, and 4.0Khz AM. The KWS-1 includes all necessary cables, connectors, relays and any other equipment necessary to mate with the 75A-4. It also includes the 4:1 knob. Along with this combo is the matching 270G-3 station speaker. Originals, not copies, of all manuals are included. Both units look and operate as they came from the factory. Price for all is $4000., for pick up only at Greer, SC (right off of Hwy. 85).

In my page on the AN/GRR-5 communications receiver
(http://antiqueradio.org/angrr-5.htm), I mentioned the claim that it will
float if the seal is still good. Fellow AN/GRR-5 owner Hideo Inoue put that
claim to the test. On his web page at
http://cherry.ayu.ne.jp/user/inoue/ANGRR5/ANGRR5.htm you can see his set
floating in a tank.

Fun!

I thought I had read somewhere that the 1R5 didn't work too good above 10mhz.
Guess they were pushing it to get to 18mhz. Still this looks like an
impressive radio. Havn't seen one for sale in quite some time.

So will a well-sealed Collins R-392!
(a watertight version of the venerable R-390)

http://users.erols.com/mdinolfo/r-392.htm

http://www.aa9tt.com/Military/R-392_URR/r-392_urr.html

http://www.armyradio.com/publish/R-392/R-392.htm

I bring one out to Ham Field Day each year
and for fun, I sit next to it in a swimsuit
with cheapie-dollar store headphones on
and the radio powered up. I then have
someone toss a bucket or 2 or water on
me and the radio, shrug my shoulders
say "Thanks it's hot out here!" and continue
to tune the radio. Makes a fun video segment.

Just looking for some info about this type of T/R switch. I am now using a dow-key relay on my old Hallicrafters which works great but just saw this MFJ model 1708 and was interested to see how it works. Has any of you old classic gear owners been using one ?

Hi,

>Perhaps a GRR-5 vs R392 'float off' is called for! The R808 might be
>another waterproof player too ~8^)

At 71 lbs, it would take ten men down with it.

How many remember Kenneth Grayson's description of the Model 19
Mark II in his "Surplus Schematics Handbook" (p.66)? "For practical
conversion data, see CQ, February 1957."

If you look that up, there's a photo of a Mark II attached to a
line being lowered off a boat.

Micas of that value and voltage rating seem to be pretty scarce. However, RF Parts does have 10KV .001 "Plate coupling capacitors" for 2.45 and bypass caps of the same rating for 1.65.

Unfortunately they have a pretty hefty minimum order, $25 I think, and most of the stuff they have is pretty high priced, so it can be hard to find that much that's worth buying (at least for me). But, if you need a couple of 3-500Z's that'll make quick work of that minimum ...

Hi, Ed,

Since you are looking for late-model equipment, my guess is you would not be interested.....but, no harm in asking:

I have a Yaesu FT-650, a wonderful six-meter rig (also has 12 and 10 meters).
I also have an Icom 735, nice hf rig, but the vintage is probably 1990 or so.
Also, I have an Icom 271A, two-meter transceiver.
I would be interested in a trade in the event you would be interested in some combination of the above.

Let me know if you would have any interest.

Good luck

Rapid Electronics (in the UK) stocks production quantities. They are all
500V. Price for 820 pF is 1.23 UK pounds each, one off.

This is a Kepco Model 605 and will power just about any boat anchor you
throw at it. It provides:

0 to 600 Volts DC variable at up to 500 mA continuous duty and is fully
electronically regulated to within .3 Volts.

It also provides minus 0 to 150 Volts bias and 6.3 Volts at 20 Amps.

DC supplies are fully metered.

This power supply is a brute and is for pickup only near Ventura, CA.
It is rack mount, 10 1/2 x 19 x 17 and is heavy.

$150.00

409 and a scrubbing brush is often a good idea. Sometimes naptha isn't
a bad idea if there is tar or gum. The dishwasher sometimes is a good
idea for stuff that doesn't have transformers, but it can get water into
transformer windings that is hard to get out.

>What's the best way to remove rust on steel chassis? Suggestions?

Start with something mild, like Navel Jelly. Works a good percentage of the time. Instructions are on the container. If the results are not to your liking, progress to something tougher. Sometimes a mildly abrasive cleanser like Ajax and some Scotchbrite will work. Whatever you do, avoid getting water or other chemicals where they don't belong. Beyond this, there are extreme measures, but all of these involve total disassembly of the equipment down to the bare chassis, something most of us don't want to do.

I don't know what you mean by production quantities. RF Parts prices in
100's, I suspect if you need 10,000's they would be drained pretty quick.

Interestingly, for 820 pF, their price on 300V is about twice the price of
500V. (of course, there's always that size thing!)

I don't know of any other reliable sources. Usually I try to stock up at
hamfests. Dan's usually has DSM's at good prices, but he has what he has at
the time, and certainly not 'production' quantities, although his prices
will be way better for what he has.

Digikey carries Dipped Silver MICA caps made by Cornell Dubilier GC/Waldom, the 500v/820pFs are listed for $1.33 in 100 qty. Page 660 in their latest catalogue. I believe if you call them you can get pricing for 1000 and 10,000 quantity.

This actually brings up an interesting point though. This is a pretty hefty price for a cap. What would be the closest equivalent to the S-M that doesn't run quite so high?

They cover 2 to 8 Mhz in two bands, (2-4.5 and 4.5 to 8) but the
40 metre band is very small, so they are only really good for
80 metres.

Be aware that unless you get the matching ATU called a variometer
you won't get an indication of any RF going out on the panel meter.

This is because the ATU contains an RF sniffer at the point where
the power goes into the aerial, this is then fed back down the coax
to the panel meter.

Also if it's a mark 3 you cannot have the 500 volt ground actually
grounded, it has to float...

Ken

I didn't realize DigiKey carried DSM's, they are my favorite supplier.
Those prices are similar to RF Parts price for 300V units, almost twice
their price for 500V. Interesting since it's pretty rare that anyone is
more pricey than RF Parts.

One caveat about DigiKey ... be sure to specify what you want for shipping.
Their default is 2nd day air, which is pretty expensive. Where I am at
least, 2nd day air takes 2 days, costs about $25. UPS Ground takes 2 days,
once in a rare while 3, costs $4.50. Rarely is it worth $20 to me to be
guaranteed 2 days instead of almost always getting it in 2 days!

Source record: 37920

Sirs
I've just got an RCA made RDF Receiver, Model No CRV-46123, part of "Aircraft RDF Equipment Model DZ-1" dated 1939. The receiver tunes 15 to 1500KHz and is in really good condition and seems to work wonderfully well on it's non-directional antenna input.
I'd be grateful of any information, links or history, I've done some searches but only found that they may have been fitted to the PBY Catalinas. I particularly need a schematic and any information on the loop antenna and it's 7 pin connector.
This set is like new inside and out, I bought it at a club sale with some other stuff and didn't take much notice of it until it got home, I decided the tubes heaters were in parallel, gave it 250v and 6.3v and away it went.
I also have a small Lear Avia Learadio AMT-12, it's a single channel crystal controlled aircraft AM transmitter, any information about it would be much appreciated also, date/type of aircraft etc. I assume it's fairly early but the set is marked Dayton Ohio and a search shows they were there from about 1940.
Thanks for any help
John

I use soft brush and vacuum cleaner, then Resolve foam carpet cleaner. Just a detergent and foam doesn't seem to penetrate transformers. Use tape over top openings of can IF & RF transformers. Spray all over and let stand a few minutes. Paper towels and pipe cleaners complete the job.

: >dishwasher <g>.
:
: 409 and a scrubbing brush is often a good idea. Sometimes naptha isn't
: a bad idea if there is tar or gum. The dishwasher sometimes is a good
: idea for stuff that doesn't have transformers, but it can get water into
: transformer windings that is hard to get out.
: --scott

I would agree that a high pressure spray shouldn't be necessary and
might strip paper products like labels and Electrolytic cap insulators
that you might want to save, and water just doesn't drain well from
any shield. Even with heat, the vapor gets trapped and just condenses
later.

If the Eq. is really worth it, a rag, tooth brush and cotton swabs
lightly damp with 409 or similar can clean up pretty good with a lot
less potential for damage.

I use a very small downward facing wire wheel on a Dremil tool with an extension shaft to get in tight places. It completely removes the rust. Then I mix zink,silver and grey paint to match the tone of the chassis to touch it up.

2780. FS: Boat anchors and doorstops

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-10-14 02:17:52 UTC
From: Tracy Nelson <tnelson158-@-attbi.com>
Message-ID: <kPpq9.34470$oq6.11106@sccrnsc01>
Source record: 37754
Cross-posted to: rec.radio.amateur.boatanchors,pdx.forsale

I have some assorted boatanchor gear for sale: All of it is "user grade",
6-7 out of ten, all working unless noted.

1) Hallicrafters S-38C receiver -- $35
Just another S-38C. No mods, case is in good shape, labels on bottom ripped
and cardboard back is a little the worse for wear. Was going to give it to
my nephew, but I would want to put an isolation transformer on it and I
don't have one handy.

2) Hallicrafters SX-110 receiver -- $80
My shop radio. Case is scratched (not heavily), bandspread dial is warped,
otherwise OK.

3) Hallicrafters R-46B speaker -- $75
Sounds great, grille cloth is getting a little "fuzzbare".

4) Lafayette HE-10 (KT-200) receiver -- $55
Case was beat to hell when I got it, I beat the hell out of it and it's OK
now, just a little rusty. Replaced the S-meter. This is the
factory-assembled version, it was also available as a kit (as the KT-200).

5) Tektronix 310A scope -- $25
Nice old 15MHz scope, good for beginner. No manual or probes.

All prices are OBO and do not include shipping. Local pick-up (in Portland,
OR) is fine. I don't have any pictures available, but I can take some if
anyone wants.

Cheers!
-- Tracy Nelson

What amazes me is that someone would actually attempt to purchase stuff like this off eBay. I mean, come on, the person who would sell something like this is not exactly a person of high moral character, so what in the world would even slow him down from ripping you off? Certainly not his feedback rating - a bad feedback profile can be erased in moments by simply getting a new account.

And, of course, this clown wants only a money order or cashiers check - nothing that can be easily traced to him. He is probably also using a fake "business" name to make it even harder to find him once he steals the money. And I see the suckers are already lining up - two bidders so far.

Well, as much as I hate to see CB'ers use that stuff and trashing the bands with bleed over, it's not illegal to sell/own one. It is illegal to use it, though. So I see no problem with him selling. He should note in his ad that it is not for use on anything other than amatuer radio bands.

As I recall, E-bay got into hot water with the FCC about this sort of thing
some time ago and they agreed not to permit auctions of CB amplifiers and
the like. So I wonder how this is now being auctioned.

Anyone have any ideas about this little transmitter?
Given the quality of the etched front panel, it's a good
bet that it's a prototype of something. I believe
I've seen a finished version of this, but don't remember where.
THanks and 73,
Dave S.

It is illegal to sell it. That's why our amps don't have 10 meter
capability. If it works on 10 it works on 11.

I have a hr 2510 that covers all of 10 and 11 meters. I also have a
mobile amp apx 200 watts. These items would be illegal if USED on the wrong
freq, at the wrong power outputs. It COULD be illegal to use, even if sold
to a licensed operator. I personally would not sell it to a non ham.
As a seller, am I responsible for the stuffs use? legally no, morally,
maybe. Since I hate to see unlicensed ops get this stuff, I have it sitting
in my garage, collecting dust. (my personal choice)
You can sell a man a gun, you can sell a man bullets, you can teach him
to hit his target, but only he can murder.

Hi all,

I have for sale a good condition HQ-110C receiver, with a nicely working clock. No mods, works well although is a bit deaf on the upper band. I used to have this paired with a Gonset GSB-100 years ago, and it's just gathering dust. Nice face, has logo intact, no serious wear or tear, all original knobs. The only real flaw is one panel screw is missing and the 'bandspread' lettering on the face is worn.

$125 plus UPS from 98466 (around 30 pounds boxed). Payment via US Postal Money order, Paypal, or check (must clear first though).

Pictures are here:

http://www.boatanchors.com/stuff/hq100/face.jpg

Thanks for looking,

David WB7AWK

Source record: 37768
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap,rec.radio.amateur.equipment

For Sale:

working Hammarlund HQ-110C ham band only receiver, with working clock. Hears well on most bands - controls need cleaning, but is essentially in good shape. Missing the 110C logo on the front, and has 2 mods on the rear apron - neither of which is anything big. There is a BNC antenna jack and an RCA speaker jack, installed in the preformed mod holes that the receiver already had. They are sensible mods, in that they do away with the screw terminals. But easy to undo. The clock works - makes a vibration that's a little annoying - I think the grommets that mount the movement are worn and the vibration is getting through.

Received 20 meter SSB and CW this afternoon with no problems.

Price is $125 plus UPS from 98466 (around 30 pounds boxed). Paypal, US Postal Money Order, or checks (10 days to clear).

Hi All:

I have decided to lighten the load a bit more. I have a nice clean Millen model 90651 Grip Dip meter with a; 7 coils in the metal rack . It is very clean and works fine. It comes in a nice plastic case which is not original Millen equipment but it houses the GDO and coils very nicely.

I have decided to sell it because I just don't use it anymore as I have a newer one that is solid state and it is more convenient because it is battery operated.

I am asking $100.00 plus the shipping cost. If interested please reply by e-mail to mc@sover.net

73 all,

Michael

<< Well, as much as I hate to see CB'ers use that stuff and trashing the bands with bleed over, it's not illegal to sell/own one. >>

As I recall the Regulations, it IS against the law to sell amplifiers that can operate in the CB frequencies. As a ham, there are limitations placed on your "right" to sell amplifiers. As a ham, you should read the CFRs on this topic.

Don

Sadly, most of the amps made for CB use aren't legal to use anywhere and
don't have anywhere near the spectral purity required for 10M operation.
That's the real problem.

I don't worry about CBers using outrageously high-powered amps and trashing
their own bands. What I worry about are CBers using outrageously high
distortion amps and trashing the ham bands with spurs.

> As a seller, am I responsible for the stuffs use? legally no, morally,
>maybe. Since I hate to see unlicensed ops get this stuff, I have it sitting
>in my garage, collecting dust. (my personal choice)

I'd sooner see unlicensed operators get clean linears for them to use than
to get cheap junk that makes hash of bands that legitimate users are
trying to work with.

The FCC appears to have given up on enforcing any regulations regarding
the CB bands, and the CBers don't seem to care about self-policing, so
I can't really make much comment about the trashing of the CB bands.
But I can sure make a lot of comments about the trashing of 10M and 6M...

Not a QRP dude but, I feel if you cant do the job with under 200 watts, why add to the clutter. All my friends have amps to use "only when needed" yeah, right! Amps create the need for amps.
I have none here anymore, so if you here me out there, it is because my (our) antennas are right, the conditions are right, and no one is chasing a cert for "worked all operators" or something. OK, I have said my 2 cents worth, opened up for the flaming contest replys, etc. Enjoy the hobby!
Thats all I have to say about that.....F Gump

Actually, you need to look at the regulations again. A change in the rules several years ago made it illegal to sell non-certified equipment capable of transmitting on the frequencies in or around the CB band (95.603, 95.607, 95.639, and so on).

> He should note in his ad that it is not for use
> on anything other than amatuer radio bands.

It doesn't matter what he says in the ads, if it can transmit on the frequencies in or around the CB band, it is still against the rules.

Probably because he avoided using the combination of words or circumstances that would trigger eBay's auction filters (he listed it under ham radio, not CB, and didn't mention CB in the page). Because of that, eBay never even noticed it. If someone had complained, it would have been pulled.

They (CB'ers) wouldn't pay the price for quality. They want lots of power cheaply - that's why this auction failed (it was too expensive).

Then what about older 50's era ham transmitters that have the 11 meter
band already on them? I suppose a ham could legally sell that to
another ham as the average cb'er wouldn't know how to tune a tube
based transmitter.

>> He should note in his ad that it is not for use

Still it might be fun (and very illegal) tu tune an old collins (50's
era) rig (like the 32-v series, KWS-1 or KW-1) on Ch 19 (27. whatever
it is) and QRM the cb'ers for awhile.

100w (or even a KW) of dead carrier (or whistles & other noise) would
drive them nuts on a cb channel. But then I really don't like cb'ers
anyway.

Would I ever do it? Nope...

Hmmm .. Depends on what "average cb-er" means. Lots and *LOTS* of ham amps .. SB-200, SB-220, L4B, FL-2100, etc, have wound up in the radio shacks of CB-ers.

Some CB-ers might consider themselves "free-banders", but they operate in the 27Mc band.

Since there was a big buck to be made in that market, at least 2 equipment manufacturers accomodated the customers with products dedicated to or modifiable for that band segment.

Swan, DBA Siltronix made the 1011 transceiver with the "slider". Yaesu made at least one version of the FT-101 transceiver with a crystal socket and band switch position for 11 meters.

Both of these radios exceeded the power levels and band coverage allowed for CB.

Forgive the cross post, but you RF guys will love this.

FA: AKG HEARO 999 DOLBY DIGITAL WIRELESS SURROUND HEADPHONES $199

This is the best wireless surround on the market, because you can walk all around your home and not lose the signal. Others use IR, and you must stay glued to the room. Adjustments for your particular ears changes the DSP settings for optimum performance. Also has tone controls, and many other features.

This one too. Same deal, please give me a couple days to get payment
to you.

> 73 Mike
> VE3MKX / VA3HKT

I am a repeat customer.

I have an SB-401 that I will be refurbing in a year or two. I need a
manual for reference.

I have an HW-2021 that I might refurb. These are relatively worthless
but had interesting features. I had a manual but have misplaced it.

I have been refurbing Heathkits, especially the SB-303 ham receiver.

de a h 6 g i portable W 4.

ps to those who are uncertain about buying on the net, I have bought
from Mike and am a satisfied repeat customer.

If it puts out more than the specified limit of (I think) 5 watts AM or
24 watts p.e.p. sideband, then 'taint legal. If the radio transmitts
more than thee limits then it can't be certified for that band. Ham
equipment, to be legal, but since when did being "legal" mean anything
to CB'ers, would have to have the drive reduced considerably.

Guess that most do not take time to look at the rules now: The ham rules are about the only FCC rules that say what you may not do , not what you may do. If it is not in the rules, it should be ok tuil a rule is made.

Here is a cut and paste from the arrl.org copy of the rules. It only addresses the amplifiers. It has nothing to say about the transmitters. Also seems to exempt any amp made before the date the rule was made.

97.315 Certification of external RF power amplifiers.
(a) No more than 1 unit of 1 model of an external RF power amplifier capable of operation below 144 MHz may be constructed or modified during any calendar year by an amateur operator for use at a station without a grant of certification. No amplifier capable of operation below 144 MHz may be constructed or modified by a non-amateur operator without a grant of certification from the FCC.
(b) Any external RF power amplifier or external RF power amplifier kit (see 2.815 of the FCC Rules), manufactured, imported or modified for use in a station or attached at any station must be certificated for use in the amateur service in accordance with Subpart J of Part 2 of the FCC Rules. This requirement does not apply if one or more of the following conditions are met:
(1) The amplifier is not capable of operation on frequencies below 144 MHz. For the purpose of this part, an amplifier will be deemed to be incapable of operation below 144 MHz if it is not capable of being easily modified to increase its amplification characteristics below 120 MHz and either:
(i) The mean output power of the amplifier decreases, as frequency decreases from 144 MHz, to a point where 0 dB or less gain is exhibited at 120 MHz; or
(ii) The amplifier is not capable of amplifying signals below 120 MHz even for brief periods without sustaining permanent damage to its amplification circuitry.
(2) The amplifier was manufactured before April 28, 1978, and has been issued a marketing waiver by the FCC, or the amplifier was purchased before April 28, 1978, by an amateur operator for use at that amateur operator's station.

The comercial station engineers have not been required by the FCC to be tested and licensed for many years now. I have not really kept up with it, but think that unless it involves radar or public transportation such as airplanes or boats there is not much need of the old comercial license anymore.

I reported the auction to Ebay and immediately received notification
that it had already been reported. It remained for the duration of
the auction even though it did not sell. Either Ebay ignored the report
or they felt it was legal for auction.

Part of the "type acceptance" for a particular radio service is also limits on the harmonics and other spurious transmissions put out by the rig. On every radio service other than amateur radio and commercial broadcasters, the user is forbidden to modify their equipment is any way. Essentially all of these services are "appliance operators" only, and anything else is a violation for the FCC. How aggressively the FCC rules are enforced is a seperate issue. Speeding is always illegal, whether or not a state trooper catches you at it.

Commercial broadcast engineers are trained, tested and licensed, and their equipment is required to meet certain spectral requirements. They need to be able to verify this at any time the FCC asks.

Amateur operators are allowed to modify equipment as well for use on certain bands, but are supposed to be knowledgable enough to do this without creating spurious emissions that interfere with other bands, services, communications or electronic devices, and smart enough to fix problems before operating.

I've seen CB antennas advertised as being able to handle tens of thousands of watts, for a service legally limited to 5 watts into the antenna. Some of the people building the linear amplifiers and other gear are unaware or unconcerned of spurious emissions, and the problems created for others. Equipment is built to go into "additional" high and low CB channels, which are actually frequencies allotted to other services. All of these are thoroughly illegal, just part of the "outlaw" mentality.

It is the users who may face the brunt of any legal actions, and users of other services who have to deal with the interference (and legit users of CB finding it useless).

Happy trails,

I'll check with our radio club's president, whose day job is as a
broadcast engineer for a local network affiliate's stations.

I imagine that a license would be helpful in getting a job, though.

Hello,
Thanks for having a look at this
I am looking for a circuit diagram, description of operation and a
parts list for this amplifier.
If possible a PDF file or a link to some site that has the same information
so I can pass the information on to a friend whom needs to service /
rebuild his amp.

P.S.
any mods / improvements / better cooling ?

Thanks Martin G1GYC

IIRC, 11 meters was a valid ham band in Japan during the '70s. That
is the real reason that Japanese ham gear that made it to the US had
11 meter coverage.

Ralph,

You are right, broadcast does not require any kind of license anymore, and most stations are not giving much weight to a GROL.

The legal limits on CB, since 1977, are 3.5 watts AM at 50% modulation, and 25 watts PEP on SSB.

- 8x11" spiral-comb bound reprint of the 5x8" original War Department Technical Manual #TM11-874 from 1944.
- Easy to read and the spiral binding allows it to lay flat on your workbench.
- Section one "Description" covers frequency coverage, tubes and circuits, power requirements, and performance specs.
- Section two "Installation and Operation" is the operator's manual.
- Section three "Functioning of parts" describes in detail what every single part of the radio does.
- Section four, "Maintenance" covers inspection,lubrication,replacement of tubes-bulbs-fuses,field adjustments,trouble location chart (simptoms & probable causes),voltage readings (every pin of every tube to ground),resistance measurements (every pin of every tube to ground),alignment procedure, and performance checks.

- Lots of pictorial diagrams and a complete fold-out 11x17" schematic. Instructions for re-stringing the band indicators are included.

- If you have an SX28 that you are restoring you should have this 63+ page manual to aid you in your restoration

Selling for $16.00 +5 S/H

If you are interested, please contact me.

Thanks.

Not any more. There's no First Phone certificate at all, and any bozo
off the street can become a broadcast engineer. Many do. I spend a lot
of time cleaning up behind them.

The equipment does need to meet certain spectral requirements but there
are no regular proof of performance measurements required any longer by
the FCC. Equipment does need to be type-accepted but you can use homebrew
transmitters on the air for broadcast service if they meet the requirements
and if the correct labelling is applied to the cabinet.

>Amateur operators are allowed to modify equipment as well for use on
>certain bands, but are supposed to be knowledgable enough to do this
>without creating spurious emissions that interfere with other bands,
>services, communications or electronic devices, and smart enough to
>fix problems before operating.

And amateur service is the ONLY service that does not have type acceptance
requirements on the equipment. This is unique and it is what allows hams
to use gear originally intended for many other services.

>I've seen CB antennas advertised as being able to handle tens of
>thousands of watts, for a service legally limited to 5 watts into the
>antenna. Some of the people building the linear amplifiers and other
>gear are unaware or unconcerned of spurious emissions, and the
>problems created for others. Equipment is built to go into
>"additional" high and low CB channels, which are actually frequencies
>allotted to other services. All of these are thoroughly illegal, just
>part of the "outlaw" mentality.

Historically, when did this start? I know CBers from the sixties
who say that the CB bands were once very polite and that CBers even
sent QSL cards. I saw the CB boom in the mid-seventies when all
pretense of politeness and legal niceties were gone.

> --scott
> --
> "C'est un Nagra. C'est suisse, et tres, tres precis."

I am not an expert on the history of CB -- but -- I was a ham when 11 meters was turned into the Class D Citizens Band in 1959. My recollection is that it was intended to be a business band. At that time, the only way anyone could have two-way radio service was the expensive route -- buy commercial gear, have a licensed engineer install and maintain it, etc.

The Class D CB was supposed to provide the little guy with simple, short-range radio communications:
-- tractor to farmhouse
-- florist to delivery vans
-- and the like

A lot of old, stick-in-the-mud traditionalist hams argued that enabling people to get two-way radio equipment with no test and no qualifications other than fill in a box top was a recipe for disaster. But what did these old fools know about it?

My rig at the time was an old Harvey-Wells TBS-50D and a Hallicrafters receiver of some sort. The H-W had 11 meters --807 in the final -- I did not put it on 11 meters after we lost the band but I did listen. It was all very pleasant and polite -- in 1959.

I graduated from high school in 1962 and from college in 1967 then went on an all-expense paid dream vacation to Vietnam -- you may have heard about Vietnam -- it was in all the newspapers 35 years ago.

When I got back on the air in the early 1970's, CB was the totally useless band that it is now. The Army sent me to graduate school at the Univ of Arizona in Tucson. I set up my ham station and was on the air several times a week. I had a lot of interference on 20 and 10 meters from a neighborhood CB'er -- running a Collins S-Line complete with a 30L-1 "leener" with a speech processor and echo box both cranked to the max. I attempted to reason with the asshole who turned out to have the IQ of an earthworm -- and he was one of the smarter CB'ers I've known -- I gave up on him -- I did report him to the FCC. That was a waste of time.

CB proves that, without standards to filter out the entrants, the lowest common denominator will prevail -- and humankind is capable of some mighty low shit. Just listen to 11 meters, the "free-band," and the low end of 10.

Regards,
Joe S.

No charge for the philosophy.

Martyn:
The best spray is DEOXIT D5 by Craig - www.craig.com
I have used it with sucess on my SX-28. You can find SX-28 knobs on Ebay from time to time in various condition. There is the military manual on the SX-28A that can be very helpful even though there are some differences between the two receivers. That manual is titled 'RADIO RECEIVER AN/GRR-2 TECHNICAL MANUAL TM-11-874 and you can usually find it on Ebay as well. See my site below as I am in the process of restoring my SX-28 as well. Good luck with yours!

What's worse, is that some of the radios out there that -can- be modified,
will cover from just below 25MHz (12m) up to, through 11m and above, some
going beyond 30MHz.

There's activity from 25MHz to 30MHz, open band or not.

Since there seems little to be done about the 'free-banders', we can always
use them for Beacons between 12, and 10m.

Make the best out of a bad situation :-)

> the rules now:

Ralph, the rules you list apply to RF power amplifiers, not what we were discussing. We had already agreed earlier that the amplifier described is illegal to sell, as is any non-certified device capable of transmitting in or around the CB frequencies. However, this brought up the issue of early transmitters with the 11 meter band built in, which is what we were discussing when you joined in.

I've seen several auctions pulled, so obviously eBay does pull these auctions when they discover them or are made aware of them. Again, this one probably slipped through because it was listed under ham radio and didn't mention CB. Sadly, the eBay employee who received your complaint either didn't understand auctions like this violated the rules or didn't understand the auction item well enough to realize it violated the rules. These employees are often not radio literate, so we have to explain these things carefully to them.

The limits are 4 watts AM and 12 watts SSB. See the Code of Fed.
Regulations, Title 47, Sec. 95.639...

(c) No CB transmitter, under any condition of modulation, shall exceed:
(1) 4 W Carrier power when transmitting emission type A1D or A3E;
(2) 12 W peak envelope TP when transmitting emission type H1D, J1D,
R1D, H3E, J3E or R3E. Each CB transmitter which transmits emission
type H3E, J3E or R3E must automatically prevent the TP from
exceeding 12 W peak envelope TP or the manufacturer's rated peak
envelope TP, whichever is less.

You hit it right in the head - the mid-seventies. In late 1973, when I got my first CB license, it was a relatively tame radio service. By 1977, when I got my last CB license, it was a mess following the trucker movie boom in the years just before that.

Sounds like 'Brenda Ann' was spouting the BS that a lot of the CBers
passed around when they went from 23 to 40 channels, and the hardware
suddenly had to be 'cleaned up'.

I've seen legit auctions for SB-200's pulled. In one case, I'm
guessing that the title included "LINEAR" or "AMP" or some other term
that didn't pass their filters or maybe the listing was somehow linked
to a CB sales area.

The amplifier mess is one of those problems without a good solution.

Then there was an SB-200 that went for way above my price range. I'm
told that happened because it included some un-described but visible in
the picture, CB products. One was called a "Golden Eagle."

BTW, I'm looking for a "needs-work" SB-200. Strangely, these have been
going for over $250 on eBay.

The CB band was beter than what I have heard on 80 meters now back in the late 60s and untuil I stopped listing to it around 1973. Most were running about 100 to 500 watt amps at the house and from 50 to 100 watts in the cars. The amps were using from 4 to 12 of the 1625 tubes. Guy in Elkin, NC made a bunch of them. No one payed the rules any attention but atleast there was none of the bad language and such being used.

Those specs were directly from the manufacturer.. I bought several radios in 1977 (had to replace the ones I had, which were no longer legal, and right on the box the specs said "new standard 25W PEP SSB" I'm in the process of looking for some of the old radios in a google search to post those specs. I have found that the new radios are limited to 12W PEP.

Yep. By the way, speaking of CB myths from that time, many were confused about the rule that says a CB antenna can be no higher than 60 feet or 20 feet above an existing object (building, tree, etc) if higher than 60 feet.

Many thought that meant no antenna could extend above 60 feet or above 20 feet when on a mast. As a result, many installed mast supported antennas only 20 feet above the ground. It was years before most "got" the meaning of that rule.

But not all "got" it. Confusion about this rule still exists to this day. When I first visited this area several years ago, I noticed a local CB radio "expert" had a huge quad mounted on a small mast - the bottom of the antenna was only inches off the ground. When I asked why, he cited this rule as the reason his antenna could be no higher than 20 feet.

Speaking of "not getting it", as I drive around, I notice antennas, and sometimes I notice some pretty odd ducks. Probably the best one, in the "not falling down" class, was a CB ringo ranger, with an expensive (yaesu?) rotor mounted underneath.

Well, maybe there used to be a beam up there.. :)

Rules, Laws all mean nothing to commercial business.

At any Travel Centers of America truck stop you can find radios that cover
25-30 Mhz, 100 watt power rf amplifiers
HF rigs all sold to anybody. Not just a few but dozens of chinese copy
rigs.

Saw one that had a band switch labled "10 meters, 11 meters, open"

Wonder what "open" means..

2873. Need HQ-129X Replacement Front Panel

Does anyone know where I can locate a replacement Hammarlund
HQ-129X front panel? I heard there are some new remanufactured
front panels but I don't have a clue to where to locate them.
I could also use an unmarked or unblemished used replacement.
Any leads or information on where I can purchase one is
appreciated. Thanks.

Lots of tube have a bit of purple glow. It isn't gas, but electrons that escape through the plate structure (holes usually), and strike the glass envelope making it fluoresce. If you look at the plate of the 6EA8, you will notice a couple of big holes in the plate structure. The blue glow will be on the glass outside of these holes.

6EA8, and 6U8's are famous for this.

judging by the amount of traffic it generated in the newsgroup, I'd say it's nothing more than a conversation piece. ;-)

What it is though, to answer your question, is an illegal amplifier for 11meters.

2 transistors driving 8 in DC service - these are generally trunk mounted, with oodles and gobs and lots and lots of DC AMPS driving it.

Someone posted somewhere, pictures of the SuperBowl of key-down contests, with some vehicles running up to 7 and 8 SEPERATE alternators, to get the desired amount of amperage capacity to run one of those things mobile.

All I want to do, is run a pair of 4CX250b's in class AB1 mobile for a little bit
of extra power output to my bugcatcher on 75 and 40m. Perhaps it's time to look at solid-state transistor amplifiers.

Has anyone used/heard/worked with the new Class E amps?

One single MOSFET device, ran on around 115vcc with an efficiency rating of like 95%?

one device - 500w out on 40m.

Since I was born in 1959, I missed the early days of CB. So I can't
say what it was like.

But reading old magazines, I got the impression that right from the
start, some saw it as a hobby band. I've seen articles from the time,
from Don Stoner and/or Tom Kneitel, outright talking about this new
band as a hobby band. And I've seen bits in Popular Electronics
where the FCC was sending out announcements trying to curb the hobby
useage. Both indicate that what the FCC intended for the band wasn't
necessarily what the people using the band were expecting it to be.

And there was a slow reduction in the rules. Not on the big things like input power or skip, but little things like who you could contact and a time rule that I can't really remember.

Surely, the FCC had intended the band to be a solution to a need (ie keeping in contact) where at the very least a lot of people were seeing it as a hobby, for the sake of talking on the radio.

I have no idea what was being seen out in the general public eye, but looking at the hobby electronic magazines, one really gets the impression that it was a hobby band (which doesn't have to mean DX'ing and illegal operation). Those with CB callsigns would put them after their name, just as a ham might, though for CB it was not the same sort of identifier. There were all those construction articles, and ones about getting the best signal, almost as if they wanted ham radio without the testing. Electronics Illustrated even ran a construction article or two for the Class E band (the one that was proposed for 220), even though there was no indication that the band was on the way.

> though. So I see no problem with him selling. He should note in his ad that
> it is not for use on anything other than amatuer radio bands.

But that's the whole reason that there is a ban on 10Meter amplifiers.

There was a time when it was easy to find amplifiers being sold that
covered ten meters. They put out maybe a hundred watts, and all required
an input drive of what you'd get out of a CB set. You'd see them in
the magazines and the big catalogs, and they all had disclaimers:
"Illegal for Class D Citizens Band use". But from the context,
and the specs, you knew very well that they were being sold specifically
for CB use. If nothing else, the fact that they were on the CB pages
would be a dead giveaway.

They were selling something illegal for use, because they could claim
that it had a legal use. There was no way, because they are so close
together, to have an amplifier that would cover 10 meters and not 11.

So about 1977, when CB had become a pretty big fad and hence more
people started using it (and increasing the number of illegal amplifiers
in use, if not the percentage), your FCC put into place rules
about 10Meter amplifiers. You couldn't buy one commercially.
There were restrictions on resale. And other than general limits
on power and spurious emissions, it's the only rule for amateur
radio in the US that restricts what you can buy.

And the big joke is that the rule has nothing to do with amateur
radio, the issue wasn't hams using more power than they were allowed,
but another service and the illegal amplifiers being sold to them.

The biggest mistake, IMHO, was putting CB where it is in the sprctrum.
If it were somewhere in VHF or UHF, then "skip" wouldn't be an issue, and
there would be little to no demand for high power.

Of course given the time when that went down, it's understandable.
A 440 CB band in 1955 would have been quite a feat!

I have to clean out some of the stuff in the shack.

OK here is what I have, all in good condition and complete except as noted.

1988, 1994, 1995, 1996, 1997, 1998, 1999 x march, 2000 x december, 2001 x
january.

I'll also throw in the following HR's with the lot if you want them all.

all 4 of these are 1978; march cover damaged, april, may, june.

I'll send these to anyone who wants them for shipping. The last time I
shipped QST's the cost was about $5.50/year with the postal rate hike.
If anyone wants a year or all years let me know.

Soon they have to go out. I'll try the local library and school first, but
failing that, unfortunately its to the trash.

I have worked with the newer Harris AM rigs, which use a PWM generator
driving a switching transistor like this. Each module has two output
transistors and puts out 1KW or so. You rack them up in parallel for
up to 50 KW, off the same driver stage. If one or two modules go, you
still have output (unlike with a conventional tube final obviously).
SUBSTANTIAL reduction in power bill at the transmitter site.

I knew there was one, but I didn't know it dated that far back.
We had a couple guys in Hawaii, from motorola, that were using it.
6 channels IIRC, and basically they had their own private band, as nobody
else seemed to know it existed, and 2500 miles of isolation from all the
other potential users.

Brenda

It was still BS. Mostly propagated by a few individuals and even some companies that had really crappy radios and couldn't get them to clean up.

The spec USED to be 5W of INPUT power with a max of 4W out, and 12W pep. (Which is actually the same thing, just measured a bit differently). The old rating was from the days of specifying tube power, and in that case you had to measure ALL input power other than the filaments. With transistors, it was changed to just output power.

And yes, there were some real crap for CB sets that DID only put out 3 or even 2 watts of power. And couldn't even do that cleanly. But others went right to the 4w limit or even higher if they were 'tweaked'.

I had a CB set in my car back then. I ran a TRC-152 which was almost the same set as the TRC-452. The 152 was the 23 channel version, the 452 the 40 channel version. The ONLY differences were the 452 had a different power plug (with some suppression on it), suppression on the all the jacks, including the mic jack, and a VCO that the PLL would only run to about 50 channels wide. The TRC-452 VCO was an IC with a bit more gain to work reliably at 40 channels (which actually meant 45 channels 'wide' in frequency) and it would actually run about 60 or 70 channels wide. And the channel selector switch.

But, you could install the 40 channel switch from the TRC-452 on the 23 channel TRC-152 and have a '40 channel' radio that couldn't be told apart from the 452 on the air. (Well, you DID have to add a small cap and resistor on one data line...)

The 152/452's could be cranked up just over 5watt, but if someone who know what they were doing (NOT one of the asshole BOZO CB techs) put the thing on a scope and did a trapezoid adjustment you could tweak the audio compression and gain and the power and have an incredible sounding radio. I did mine on a scope and the best performance was achieved at about 3.5w. I had a guy want my radio so bad he kept offering me full price for it. I offered to set up a new 452 for him the same way, but he kept insisting that "I want YOUR radio". So I sold it to him for list price.

Again, and I can't say this strongly enough, the spec you posted was utter BS. It doesn't matter if it came from a CB set spec or not, it was BS. The 40 channel radios (from some manufacturers) were SUPERB compared to most of the 23 channel stuff that was before them. In fact, one of the best 'hack' radios ever made was the Uniden chassis 40 channel SSB set that was sold by Radio Shack as the TRC-449, TRC-457, and TRC-458, by Cobra, Uniden, and President, and even others. I know a NUMBER of HAMs that converted that to 10M and it made an incredible radio. In fact, I have 2 of those units here, converted to run as the '10M core' of my 2M SSB station. At least, they were, until I bought an Elecraft K2. (Now THAT'S a nice radio!)

If I'm not mistaken, the Class A band was restricted to licensed
communication between the 'same license'. Like different trucks for
a business. There was no provision for interbusiness communication,
or even family communication.

The 11M CB band had those same restrictions initially, but NOT on
all channels. Some channels were allowed to be 'open communications'
between different licenses.

Hello All:

I am looking for a copy of an Eico 723 manual. It's my first novice transmitter (Circa 1971), and I would like to restore it, but I have misplaced the manual.

I will gladly pay all copying and shipping costs.

Thanks for your help,

Nick KZ9P

> But that's the whole reason that there is a ban on 10Meter amplifiers.
>
> Michael VE2BVW

Well, not quite. There is a ban on NEW amplifiers being sold by
manufacturers. They can't even be 'convertible to 11 meters.
Or even to 10M and I think the latest ruling includes even 6M,
I'd have to check.

And old amps that can cover those 'restricted' frequencies are
controlled, but NOT prohibited.

But, it is still legal for a HAM to construct his own amp that covers
any frequency. As long as he doesn't build more than a certain
number a year. (I think the current number is 2, but I'm not
sure. I'll bet someone chimes in with it though!) And, those amps
are legal to be sold.

That is not to say they can be USED on any frequency!

In fact, having an amp that can function on 11M connected to
equipment that implies it's use can be considered 'evidence of use'
if you get caught with it. Having an amp connected to, say, an
Elecraft K2 or a Yasau FT-817 if you're a HAM would NOT
be an issue. But getting caught with the same amp connected
to a Cobra 148 CB set, even if you ARE a HAM could get
you nailed. Unless you could show that the 148 was converted
to 10M...

Whoa Mike, what's this "evidence of use" business? If that is a principle of law, then why are non-hams allowed to own ham transceivers?

What difference does it make what radio is connected to what amplifier?

I repair and refurb Heathkits, I could easily switch the crystals for one of the 10 meter slots so that an SB-101 would work on 11 meters.

In fact, I think I'll modify one of my SB-303's to cover 11 meters.

Also the last time I bought a car, the dealer did not ask to see my driver's license.

I disagree with the word "most" in that. Most were running legally in the early 70's, with only a few running illegal equipment. Of course, ten years later, all of that had slowly changed to the point where most were indeed running illegal equipment of some kind. By the end of the 80's, almost all were using some form of illegal equipment (modified radios, "tuned up" radios, amplifiers, and so on).

With now perfect 20/20 hindsight, I'm sure the FCC would probably agree. However, at the time, CB was supposed to be a business band (for truckers and such), with employees too busy working to play around with "skip." Likewise, at the time, the FCC could not have foreseen the trucking movies, and resulting CB craze, of the mid 70's. Nor did they likely suspect that millions would eventually openly flaunt the rules and regulations, using illegal equipment, and using CB for some other purpose (a hobby band). If anything, the FCC was simply too naive and trusting when they should have expected the worst behavior from most people instead.

Guess that it depends on where you were located .. I knew a bunch of the cb operators in 68 to 74 and most of them in the area did run some kind of amplifier. I used to pick up spending money by working on the equipment for them also.

If you do not have a ham license but have a CB set in your house and an amplifer that can be used with it even if it is not hooked up then that could be called evidence of use. You would seldom have any use for the amp if it was nto for illegal use. Sort of like if you have some lock picking tools and you are not a locksmith. Maybe like being out in the woods with a high power rifle when deer season is out and you try to tell ghe game warden you are rabbit hunting. In some states it is illegal to have an open container of an alcoholic beverage in the passenger area of a car. Not that you are drinking, but that is just the way the law is written.

RULE 11 - Linear Amplifiers -
{A} You may not attach the following items (power
amplifiers) to your
type accepted CB transmitter in any way:
[1] External radio frequency [RF] power amplifiers,
also called linear
amplifiers, or linears;
or
[2] Any other devices which, when used with a radio
transmitter as a
signal source, are capable of amplifying the
signal.
{B} There are no exceptions to this rule and use of
a power amplifier
voids your authority to operate the station.
{C} The FCC will presume you have used a linear or
other external [RF]
power amplifier if-
[1] It is in your possession or on your premises;
and
[2] There is OTHER EVIDENCE that you have operated
your CB station with
more power than allowed by CB Rule 10.
{D} Paragraph C above in this section does not
apply if you hold a
license in another radio service (HAM, etc.) which
allows you to operate
an external RF power amplifier.

The Amp don't have to be connected to anything at all-

Greetings!

6 meter ssb/cw/am rig:

I have for sale a nice TR6/AC4/MS4. Looks good, works great! It was gone thru by Drake just prior to them closing their ham-repair operation. I have the paperwork from Drake. I also have the manual. $950 plus shipping, or pick up in Lincoln, Nebraska.

Looks like the FCC is pretty reasonable, they require "OTHER EVIDENCE".
I
suppose, field strength tests or the blue glow of corona discharge off
the ends
of the Yagi qualify.

Simply owning the amp isn't "evidence of use". While they don't want
you
to connect the amp to the transmitter, they don't spell out consequences
for
doing so.

They do spell out consequences for connecting AND using, the
consequence is
voiding the authority to operate.

Thanks.

He says all 10 "pills" are finals, but clearly the two on the left are
drivers.
I'm skeptical in many ways about the claims listed.

The coax looks like RG-58, which might handle 2kW, but I sure wouldn't bet
on it.

Also, the toroid on the output looks way undersized for2kW.
It's hard to scale the picture though, I could be wrong.

Anyone see any DC wiring that looks good for say 220A? (2kW output, so 4kW
DC input, at 18V is 220A, assuming NO droop in the supply leads.)

Taking those eight pairs of transistors on the right to be the finals,
that's 500W/Pair, or 250W each device. Not knowing what device, hard to
say, but it seems pretty dubious.

Frankly, I'd be surprised to see 1kW out of it.
Here's a real 1kW box. :)
http://www.rockwellcollins.com/ecat/gs/PA-2220A.html?smenu=4

Here's a nice article on HF amp design. Note his comments on power
requirements and efficiency.
http://www.qsl.net/ab4oj/quadra/sshfamp.html

Good views and more info on the internals of a proper design.
http://www.qsl.net/ab4oj/quadra/quadra.html#LINKS

Note there's no filtering in the picture, input or output. Likely very
dirty signals.

They are cheap film caps. They can be used to replace any paper capacitors.
Antique Electronic Supply has them, as does Newark and a lot of local
suppliers. They aren't anything wonderful, but they don't fail easily and
they don't change value much with temperature.

RG-58 will handle 800W on the AM broadcast band if you are very careful
about standing waves. It's actually kind of neat tuning the antenna system
up by feeling where the warm spots in the feedline are.

>Also, the toroid on the output looks way undersized for2kW.
>Frankly, I'd be surprised to see 1kW out of it.

Only if saturation is a problem. If you don't care about spewing huge
amounts of RFI or legality, it should be fine.

Hey Lou, since your charts that allow "for modification to 10M or other freqs." are obviously intended for use by licensed hams, you might get more business if you posted this in ham newsgroups. Doncha think?

I wonder how calling it the "Citizen's Radio" service influenced the
public's view of the band? Those good ole boys and ratchetjaws were
citizens, so it just rationally must belong to them.

Now don't forget good buddy;
Have a good day today
and a better day tomorrow!
(Must be pronounced with an Arkansas accent, even if you're from Vermont.)

Well, that obviously didn't help, did it, Ed? I wonder why they did actually call it a "Citizens Band." Did they have some other concept of "citizens" at the time (mobile business users) or was that name added sometime later?

Yes. I agree. Start the opening at $1, $5, something like that. Write about how many callbooks from that era might still exist or show what radios were like in 1931, maybe even tell about current events, "The Depression was just starting but your grandfather spent a day's salary on this callbook, it was a precious thing as they didn't have online callsign databases. Imagine how he looked up callsigns from distant places, some were halfway across the country. The excitment of hearing hams with their powerful AM stations...."

Add something like, "historical research, find the famous ham call signs, Howard Hughes, Hiram Maxim, ... run your fingers over the old pages, Scan this one in and OCR it for future generations, this would be a great project for your preservationist, historical research, family tree society. $75 (buy it now) gets them tens of thousands of names and addresses. Imagine hosting this treasure trove of names on your family-tree research website. This one will really put your club on the map.

This is an odd thing about the value of information. The information in that book might be worth fifty cents to fifty thousand people as it would confirm that gramps lived at 1234 Apple Street, Smallville, KS and was a licensed ham in 1931. "That's why he had that box of radio parts in the barn!"

It's not worth .5 * 50,000 = $25,000 though.

Forget the high opening bid stuff. Start it at one dollar, put a 15 dollar reserve (if you feel you need a reserve) and a "Buy it now" at $75. for true collectors who don't want to wait for the auction to end.

Well, it wasn't the "Citizen's Band". It had some other name, "General Mobile Radio Service" comes to mind, but maybe that was here in Canada. Whatever the term, it was first applied to that band up above 450MHz (which came first), and then you have the Class D band at 27MHz.

In a previous post, I mentioned early articles about the service treating it as a hobby band. One such article, again by either Don Stoner or Tom Kneitel, referred to it as the (or maybe "a") citizen band. The name for some reason stuck, and even from fairly early on, the only term you hear is CB. So much so that the formal name doesn't come immediately to mind.

One thing that may have happened over the years is that the formal name was changed to fit the slang. I have a vague memory of it maybe being formally being renamed at some point, precisely because everyone was calling it the citizen's band.

2961. FA: 12 HOURS LEFT - Signal One MilSpec 1030 Transceiver

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-10-18 19:45:48 UTC
From: "rick@rickfrazier.com" <rick@rickfrazier.com>
Message-ID: <3DB064EC.39F9DED5@rickfrazier.com>
Source record: 37684

I have my Signal/One MilSpec 1030 HF Transceiver up for auction.

This is the last chance at this fine transceiver, less than 12 hours
left in the auction.
A similar unit recently sold for $5250 without either the speaker or the

microphone.
The reserve on this one is only $3500, and the current bid is at $3325!

Only about 100 or these fine radios were manufactured, and including
this one, I've only seen three up for sale in the past four years.
Don't miss out on the chance to own one of these rare units.

The Auction on eBay includes the matching speaker and a CX7M Microphone.

The e-Bay item Number is: Item # 1387446227

To see the eBay auction for this unit, cut and paste the following line
into your browser:
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=1387446227

To see a web site page with additional information and pictures of this
auction, cut and paste the following URL into the Address or Location
line of your browser:
http://www.rickfrazier.com/ham/1030.htm

I tried to post with 24 hours left, but it didn't appear on my server.
I'm sorry if this is a duplicate message.

Thanks

Yup, all my high school friends owned at least two or more cb rigs.
The uniden were nice and they wanted me to buy in but I held firm and turned to ham radio instead. NO regrets.

My friend who was a very smart kid (1977) was obsessed with SWR to the point of bringing home dozen books on antenna and such. He ended up trimming a great antenna too short by chasing the dream of 1:1 swr !

I took his small gutter mounted antenna (loaded coil) and clipped it to the wrought iron railing in his living room and he could not believe how good the radio worked after that !

Apache Owners and rebuilders:

The following Original Apache parts are currently available:

HV transformer
HV choke
Modulation transformer
Final loading condenser
Final tuning condenser
6146 tube sockets
Modulation tubes
One pair of good 6146A tubes
VFO unit, complete
Front panel (glass cracked but easily replaced)
Meter switch
Meter
Meter gimble mount
Set of knobs (1 damaged, all others good)
Audio preamp transformers
Chassis control hardware
Drum and related assembly
Driver band switch
Final band switch

Inquire about any parts you do not see above. The main power transformer is no longer available.

Email your needs and zip code. I will respond with price, including shipping.

NO out of country shipping is available.

Cheers,

Al,

Besides the modulation tubes (are we talking about all of them or a subset?) I need one of the pie-wound RF chokes found in the driver compartment. I'll have to look it up, but as i recall it's wound in three pie-sections on a ceramic form, which in turn is screwed onto a 6-32 scrwe protruding from the chassis underside. Can you supply, once I get you more specific info?

Figure on shipping to Crestview, FL (ZIP code 32536), by the way.

regards,

Mahlon - K4OQ

Actually any use of this device would be illegal whether it be CB or
amateur radio frequencies, right Allodopeaphobia?

But then the FCC has no jurisdiction other then the USA so therefore
operation
anywhere else in the world could be possible without the worry of
jack-booted thugs
with automatic weapons kicking in the door on your jungle hut.

Of course you already knew that.....duhhhhhh......

2973. The old Morgain antenna from the 60's

Newsgroup: rec.radio.amateur.boatanchors

The Morgain antenna was a multiband dipole put other with spreaders between dipoles for different bands and fed with one coax. It might have been a somewhat short antenna, I don't recall. Does anyone know if (and who) produces a similar animal. When I try to make something similar, the elements get tangled up with one another.

Source record: 37549

The MorGain (sic) looked like very wide TV twinlead-like material, with lots of holes. The band elements were all molded into the plastic, like twinlead. QST has a couple of vendors with multi-band dipoles that appear to be similar to the Morgain, e.g.: full size elements and no traps.

This is nothing new, but I have seen more of this lately. I was looking into someones feedback and noticed a complaint. Apparently this guy sold 2 books to another person and they gave him negative feedback because he charged him $9 to ship the books, the postage only came to $2.25. The seller responded that the ad said "$9 shipping and handling". I just smiled and continued to look through eBay.
The next day I saw someone auctioning a Universal M-7000 decoder and clearly stated in the ad was this: "$50 flat shipping and handling fee." $50?!! Heck, you can ship that from New York to California, UPS for about $12! $20, if you have to buy the shipping materials!! If your bidding on eBay, beware of this kind of crap. They have a right to charge it if they say it up front (unethical as it is), but this is a blatant attempt to pad their pockets. READ THE AD CAREFULLY! If they say flat fee, don't bother bidding unless it's a fair price.
I recently bought a camera from a guy 60 miles away, his ad on eBay said flat $20 fee for shipping, I thought I might get out his way in a couple of weeks and pick it up, sorry buckaroo, he only wanted to ship it, now I know why, it only cost him $6 to ship it, where did the rest go?? Right into his pocket. @#$%&!

Literally, a box that contains pills. But, the "pills" in this instance are the semiconductors. I suppose that the typical user of these quality amplifiers must gaze upon the maze of microstrips and surface-mount components, and see only little teensie bricks and rocks and little weird round thingies, that may look vaguely like a big pill.

Ah, remember the days when marketing guys impressed us by claiming product attributes like 37 transistors, 5 diodes and two thermistors?

"The quality goes in before the name goes on.....It's a Drifter!"

Hello,

We have some antennatuners to 30 Mc from the Dutch Navy (HMS Tromp). This tuners adjust shorter antennas. They are not automatic but working with a bowdencable? We have test these tuners and with a wire of 5 meters it works well on 80-40 and 15 m. Because the wire was 1/4 of 20, it works not so good. When we make the wire longer, it tune in very well. The measurments of the tuners is about 18" * 14 " * 10". Maybe it is taller. For pictures see homepage http://home.hccnet.nl/fbj.derooy/
Cost of it is ? 110,=. This antennatuners are waterproof and you can put it on a chimnee.

We have also two automatic tuners but we have no documentation about it. See also the homepage. Price also ? 110,=

Sorry for the bad English but my dictionary is to small.

Greetings Frans PB0AKY

Hi, Chas.

My wife and I both sell on Ebay and we do not charge for packaging or handling. However, we spend a lot of time scrounging boxes, peanuts, bubble wrap and the like, sometimes driving many miles to get them so that we don't have to lay out any cash. We do have to buy tape, labels, and other supplies. Materials can really go fast when you're double-boxing and taking pains to make sure things don't get broken. We have to maintain computers, internet connections, etc. We also spend a lot of time going to the post office. Then there's all of the time and effort spent trying to find items to resell, to say nothing of the items that sell for less than we paid.

So, it's not all greed when somebody charges for handling.

To me, GE's are most easily identified visually or by describing the model family. You might have a Progress Line radio. This one is a large metal box with a T-handle lock and a small aluminum cast block on the front for two transistors that switched the 12v into the power transformer.

The Motorola was made to be wired for 6 or 12v operation and is a 2 meter unit. Either of these units could be tuned up to the nearest ham band and were popular ham rigsin the 60's and 70's. For practicality's sake they are indeed boatanchors, often found in display case relics that bring a tear to the eye of old hams and radio techs. The GGV's were close to my own age when I started reinstalling old leased units into cars for $5 per month/per unit with service agreement.

Of the few that were somehow spared the wear and tear of decades as mobile units, traded around through several vehicles, they work great and sound great on up to two Xtal controlled channels. They are no longer legal for use as anything but ham radios because of xtal oven cycling and lack of PA filtering, but Hi-accuracy xtals may be used without ovens very successfully.

Manuals are available in the boatanchor community and some units and parts can still be found in back rooms and closets for little money.

Mint condition, rock stable, four filters, RS-232c computer interface.
Prefer cash and carry pickup from my Northern Virginia location.

Why selling? I switched to a Ten-Tec RX-320 and since I'm 68 years old
most likely the NRD will lie around unused until until my heirs throw it
out when I'm dead :^)

Hoping to find a good home for it.

I still have to clean out some of the stuff in the shack. I have WAY too
much stuff after 37 years.

OK here is what I have, all in good condition and complete except as noted.
Some have been spoken for as noted.

1988,
1994(GONE),
1995,
1996,
1997,
1998,
1999 x march,
2000 x december(GONE),
2001 x january(GONE).

I'll send these to anyone who wants them for shipping. The last time I
shipped QST's the cost was about $5.50/year with the postal rate hike.
If anyone wants a year or all years let me know.

I also have about 5 years of QEX that I'll let go for shipping.

Soon they have to go out. If you know a club or school that wants them that
would be great. I'll also try the local library and school first, but
failing that, unfortunately its to the trash.

Lionel

I'm sure there are lots of honest folks on eBay like yourself, but this Universal M-7000 deal was silly, I mean $50? The unit only weighs about 12 pounds and isn't large at all, so if you had to buy the materials to ship it, I don't think it would have come to more than $10. Another poster confirmed what I thought, that many eBay sellers make a killing on shipping charges, I'm sure it's only a few in the Amateur Radio section though.

I guess you don't understand but maybe I have to spell out every
little detail. Shipping charges are whatever UPS, USPS charges to ship
an item. Any inflation of those charges would constitute a handling
charge or a shipping surcharge. We make no charge for handling,
packaging, or shipping of an item. The point that I was trying to make
is that the seller can charge whatever he wants for handling, as long
as it's spelled out beforehand, and that there might be some
justification for a nominal fee. (However, I never purchase items
where there is a handling fee involved.)

Aw, just forget it.

I agree with you that many sellers TRY to charge excess shipping and
handling. If they get it, though, it will bevause the buyer opted to
pay it, just like anybody who orders that crap on TV.

Anyhow, hams are notorious for being cheapskates so I wouldn't think
that it would ever be a problem for anybody in this group.

>
If the listing clearly states what the shipping/handling will be, what's the
problem? Is there something wrong with being paid for time and materials?

I always figure the S&H as part of the item cost. In many cases I bought
locally rather than bid because the total cost was lower locally even though
the item cost was higher, and I had to pay sales tax. All part of the game.

For the record, I charge the actual shipping cost, and no packing or handling.
Luckily I'm in a position where I get most packing materials (except tape) for
little or nothing.

Gee,
I didn't there was anyone else left (besides Wayne Green) who was
still beating the drums about that old incentive licensing issue.

Hasn't the Amateur Radio world gone thru dozens of more important
issues since then?

The problem is when the charges are exessive, Jim. Yes, as I stated, if the charges are listed, that's fine, but I am pointing out to the "unwary" that many eBay sellers are overcharging for S/H. Your an honest person and only charge actual costs, you like me have access to all kinds of shipping material, saves quite a bit of money. So do these people who overcharge. The camera I bought came in an old reused box with "recycled" packing, so I doubt he bought it, and still charged me $20. What I found to be ridiculous was the M-7000's shipping of $50! The thing weighs 12 pounds, even if you took it to Mail Boxs Etc, it wouldn't cost more than $25 or 30. Come on! How do you spell "gouging"?

I think a bit of it is to catch the unwary, but most of the inflated handling charges are to screw eBay out of their cut. eBay charges a percent of the selling cost. I don't believe that they get a cut of the "handling" charges.

Message-ID: <3DB2FE9B.4B204E34@netscape.net>
Source record: 37603

I've been refurbishing and playing with a DX-40 I purchased
a while back (I had one back in the 60's). It has a problem
that has me stumped. There is an approx 1 pps pip coming out
of the 12AX7 speech amplifier. I can see the plate current
jump up and can also see it on my scope. It doesn't appear to
be RF related. In desperation I've rebuilt the whole section
including a new tube socket....still there! Anyone have any
ideas????

73, Roger

In Tacoma, WA:

Nice Hammarlund HQ-129X receiver. Not collector quality,
but pefectly fine for most folks' boatanchor shacks. Plays
but needs an alignment. No mods or damage. Just a little
wear on the paint in places. Overall very decent condition.
This one is the 'all white' lettering version, which I believe is
newer (the older ones had some red lettering as well).

I can send photos to LOCAL parties - this is a Pickup item
ONLY, and I'll not respond to requests to ship it. Just too
heavy to deal with.

Thanks!

David Ellison WB7AWK

You're a hypocrite, Robert.

You don't like CBers, yet you plan to act like one on 27.whatever (27.185
is 19, BTW).

IF you have a license, you should already know that actions like this,
regardless of what band they're done on, are not only against FCC rules,
but against the rules of common decency.

Hello Everyone:

Kevin Gunther was kind enough to forward a scanned copy of the Eico 723 transmitter manual I was looking for.

Thank You, Kevin, for your help.

And thanks to all that responded via e-mail :)

C3 and/or C28 would be my first guess and that 470K resistor between the two looks to be the wrong value. I would think something at or below 47K would be closer to normal.

Hi Chuck.

Remember we are dealing with Ebay.

Why on earth would you expect honesty?

I had two experiences with Ebay. Experience 1 was buying an item. Sending the check to the seller, and getting something else than what I bought.

Experience 2 was auctioning the same item afterwards. Everything went well, except the person winning the auction never paid me. Darn old fee (and since my kid did the sale, and neglected to tell me, I was stuck with the fee) Contacted Ebay, and was advised "in the future, make sure to give the buyer a bad feedback" Sorry folks, ain't gonna be no future dealing with that suckers game!

Bummer, and I would have to be a fool to use that service again.

Face it, the lure of ebay is that we might get some great deal that we can brag about. It's a gamble, and like all gambling, there are a lot of people who lose. Some people have good luck with it, but eventually.....

I think your only real recourse is to blow off steam in the newsgroups. 8^)

I've had generally good experiences w/ eBay. I've been buying old
"guarenteed dead, if it starts to work within 48 hours, return for a

cheerful refund" radios.

In some cases, the seller was not up front about all the problems but they never said that the radio was an "8+, museum quality, one of the best, a keeper" and that is a tip off.

Many undisclosed problems were offset by overlooked benefits. One SB-303 came with extra filters. An SB-401 came with an extra bezel and main tuning knob.

I drop out of auctions when the price spins out of my price range. I saw some radios go for twice what I would have paid.

If you are looking for an inexpensive used generator, the EICO 324 is plentiful and usually cheap. At a swap or hamfest, they would typically go for under $50, more like $25 for an unrestored one. The 324 does not go lower than 150 khz, however. The IF for many AM radios is aligned at 455 or 456 khz. Some sets, such as Hallicrafters SX-88, are aligned as low as 50khz. An audio generator such as the Hewlett-Packard 200CD will cover ~50khz if you can't find a single generator that covers the whole range that you're looking for.

Those are just a couple that I have used. There are lots of other generators on the used market -- Heathkit, Hickok, you name it. Most tube-era generators will require the same sort of service as the radios from that time. Clean all the switch contacts and tube sockets, replace the paper & electrolytic capacitors, etc. I use a modern frequency counter to double-check the output from my signal generator, since some were not all that accurate even when factory-fresh. In a pinch, if you are aligning for 455 khz, grab a modern AM radio with digital tuning and set it for double the desired frequency (i.e., 910). Make a temporary antenna for your sig gen by winding a couple of turns of insulated around your hand and connecting the ends to the generator. Place near the radio and you'll hear a distinct buzz from the radio when your funky old generator hits the right frequency.

Have fun.

Phil

The URM-25 is an old military unit that will do the job; it covers from 10kHz to 50MHz. Another unit is the HP606 series; they cover from 50kHz to 50MHz. If you want to spend more money, a good modern unit is the Wavetek 2407; this is a synthesized unit that covers from 10kHz to 550MHz, AM and FM. This Wavetek unit is a much different design than the problem prone 3000 series, with the hard to service modules. This unit uses card cage construction, on a motherboard. Used price for the 2407 is around 600 USD; forget about that 3000 dollar Tucker price.

3058. FT-101 Low Receiver Gain

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-10-22 14:27:17 UTC
From: deWA7ZPU@aztec.asu.edu
Message-ID: <90a0ea69.0210220627.2084f075@posting.google.com>
Source record: 37631

Hello,

I am repairing an early FT-101 that was donated to the amateur radio club at Arizona State University (W7ASU). I don't know the history of the radio. At full RF and AF gain the speaker noise is about the same as the fan noise and the noise increase while tuning the pre-selector is just barely noticable.

The first thing that I did was to re-align the radio. I have the service manual. It made only the tiniest improvement.

Next, I looked at the RF amplifier. I found that the original 1077 RF amplifier board was very heavily modified into a later model FT-101 1181 board. However, the modification seems OK to me.

I noticed two things. First, the local oscillator has a 0.3 volt rms specification, but I measure about 1.0 volt. It cannot be ruduced with the recommended tuning procedure. I have ignored that for the moment.

Second, the RF amplifier itself is specified for 9 db at 14 mHz input to produce 33 db output. I am not sure what db means in this case, so I tested with a few
millivolts of 14 mHz signal input and measured unity voltage gain. I took advantage of the broadband nature of this amplifier and measured slightly off of receiver frequency to avoid AGC action. Moving onto the receiver frequency, I observed, but did not measure, a large voltage loss in the RF amplifier. The biases looked OK on the amplifier transistor, but I replaced it anyhow. It made no difference.

So, I have a few questions:

1) Am I fooling myself, and I should expect a unity voltage gain since there is an impedance transformation which represents the gain as expressed in db? In other words, this circuit is OK and I should look elsewhere for the problem.

2) I'm not fooling myself and I need to find the cause of the low gain. However, It is certainly not clear to me what that cause is. Any hints?

Thanks,
Mike WA7ZPU

Hello,

I have acquired an old EICO 753 and I am considering putting it back on the air. However, I don't have any documentation for it. I am aware that I might be able to purchase copies of the manuals but the price is likely to be higher than the value of this radio. So, if any of you have a copy of the user and construction manuals, I would appreciate the opportunity to copy them. I could scan them and put them on a CD if that would be useful to you.

Thanks,
Mike WA7ZPU

I'm just guessing, but I'd bet they are either 957A or 958A. As I recall, the 958A was the better of the two.

Fair Radio has some of the older HP units which aren't bad at all. Alternately since you will need a sweep generator sooner or later, you can get a sweep generator and use it in fixed frequency mode.

3067. Hallicrafters's peculiar oscillator

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-10-22 17:04:13 UTC
From: Tenho Hatonen <tenho.hatonen@pp.inet.fi>
Message-ID: <hyft9.412$zr4.15573@read2.inet.fi>
Source record: 37640

Hello,
I have a Hallicrafters S53A receiver in working condition. When designing an add-on digital frequency display for it, I foud that the oscillator works in different way on band B(2.5 - 6 MHz) when compared to all the other bands.On bands A(0.6-1.5 MHz), C(6-11 Mhz) and D(13.5-32 MHz) the oscillator frequency is 455 kHz off the signal frequency, as usual. On the B band however, the oscillator frequency is only half of what it should, e.g. with an input frequency of 3.6 MHz the oscillator works on fo=(3.6 + 0.455)/2 = 2.0275 MHz. Obviously the input signal is mixed with the second harmonic of the oscillator to produce the desired fi =2*2.0275-3.6= 0.455MHz. It works this way trough the whole span of the band. I confirmed this by a scope with the probe coupled very loosely (=near the osc tube, not to load it), also by listening by an other receiver the oscillator was received on the fundamental as well as on the 2nd harmonic and finally a measurement with a freq counter gave the same result. The tuning span of the trimmer cap in parallel with the fixed (not tuneable) oscillator coil is not big enough to get the oscillator to the "right" frequency.
The oscillator tube (6C6) anode voltage is on the recommented range and the construction (parts, solderings e.t.c.) seem original, not tampered.
I would be very grateful for a good explanation and possible fixes for the above phenomenon; is the S53A designed to operate like that, is it a generally used trick, why is it used (on only one band!), or is it a 'lazy' tube that is cousing this problem?
Building the frequency display to the above configuration feels a little bit too complicated, so help is needed.

Hello Mike

I would suggest you look at each stage individually instead of the system as a whole. Instead of 14 MHz at the antenna, inject appropriate signal (rf carrier, rf modulated, audio) at each stage and then see what the perfromance looks like.

Good luck

Steve

Hi Mike,

It seems to me that you should see the gain through the amp despite any impedance change. I assume you are using a scope so the high Z input should not load it down much. Bill M. makes a good suggestion to check the fuse lamp on the antenna input. Also check the T/R relay. I'd put some signal in the antenna connector and check through to the input of the RF amp for excess loss. If either T101 or T102 is bad, alignment won't make any real difference. If its T102, you will have low output as well. One other suggestion is to check the FET to make certain its installed correctly. I have seen where someone made a mistake in the past and mixed up the G1, G2, S, and D pins. Let us know your progress.

Scott M.

Mike: I have an "early" FT101 which had (past tense) the weak audio. I discovered that later versions added a single-stage 2SC372 audio pre-amp between the volume control and the audio output. I built one according to the updated diagram and everything is fine. I think any general purpose NPN silicon transistor would do, but I still have a small stock of the original transistors and can supply one and the diagram if necessary. Miki VE7AFN.

For what its worth....many of the 101 series were jacked around by CBers to operate at full blast on 11 meters. The allignment is thus totally wacked because if 10 meters is OUT then everything else is.

Source record: 37498

Bill M suggested the fuse bulb. I have verified that as OK.

Stephen Robbins suggested testing each stage at a time separate from the system as a whole. The db figures in the manual are specified for each stage, and that is how I am testing.

Scott M. suggested that I check the T/R relay and trace the antenna to RF stage path. I have verified that path as OK.

Scott also suggested T101 and T102. I have not checked these coils directly, but the fact that they can be set to peak with the assciated capacitors set at about 1/2 capacitance causes me to conclude that these coils are OK.

Scott also suggested the RF amplifier device may be installed incorrectly. Since I tested this device by replacement, I definitely reviewed its connections based on the circuit and spec sheet.

Thank you all for all of your help so far and I sincerely hope that you don't lose interest. I have a couple of things to add.

In my original post, I mentioned the overall backgound noise as being about the same level as the sound of the fan. By that, I mean the base noise of the reciever with the antenna disconnected. In my perhaps limited experience with recievers, I would expect that at full RF and AF gains that noise should be
uncomfortably loud. Am I wrong about the FT-101?

I have decided to limit my testing to 20 meters to eliminate band switching from the equation. The RF amplifier shares its output with the transmit mixer. It is not clear to me what impedance that might present, but the manual says the signal should incread 24 db in this stage. If there was no impedance change, that would reperesent a voltage gain of 16. On 20 meters, the measured gain is about 2 with all the coils peaked.

So, is the RF stage good or not?

Thanks,
Mike WA7ZPU

R7613 Scope, Storage Rack Mount $250.00
7613 Scope Opt 3, 5 $289.00
R7623A Scope Rack mount $269.00
R7633 Scope, Storage Rack Mount $219.00

7834 Scope, Storage Dual Beam $350.00
7844 Scope, Dual Beam Mod 769W $450.00
R7844 Scope, Dual Beam Rack Mount, Opt 03 $349.00
R7844 Scope, Dual Beam Rack Mount, Opt 03,22,Mod HD $349.00
7854 Scope $499.00
7903 Scope w/ Opt 3 Rack Mount $1,090.00

Plug-ins for 7000s
AM6565U Amp $39.00
7A11 Amplifier FET Probe $99.00
7A16 Programmable Amp $49.00
7A16P Amplifier $79.00
7A18 Dual Trace Amp $59.00
7A18A Dual Trace Amp $69.00
7A22 Diff. Amp $139.00
7A24 Dual Trace Amp $129.00
7A26 Dual Trace Amp $75.00
7B15 Delaying Time Base $134.00
7B53A Dual Time Base $59.00
7B53AN Dual Time Base $109.00
7B70 Time Base $59.00
7B71 Delaying Time Base $49.00
7B80 Time Base $89.00
7D15 Counter/Timer 225MHz $129.00

Plus $15.00 packing, plus actual shipping charges from Los Angeles, CA
area.

We accept money orders, checks, PayPal or credit cards via PayPal.
Overseas orders O.K. - payment in $US.
All units are tested and are functional. Not calibrated unless noted.

No. Noise level should be equal to other HF radios. I always found the
receiver on the FT-101 to be fairly good. You should notice a lot of change
as you rotate the Preselector.

Don't know now, but I'll check when I get home tonight. I have one on the
bench now.

Scott M.

I am in need of a plastic meter face or an entire meter housing for a Hickok 605A tube tester. I recently acquired one that has a broken face. I believe several Hickok tube testers had meters that are physically the same and would work. I will pay cash or would be willing to trade. Please e-mail me a kberlen@ticz.com if you can help.

Thanks, Kevin

3086. HCRA Annual Auction - Feeding Hills, MA - 1 Nov

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-10-23 01:30:17 UTC
From: "Jim, KK1W" <kk1w@arrl.net>
Message-ID: <3db5f859_4@corp-goliath.newsgroups.com>
Source record: 37509

The Hampden County Radio Association will be holding it's annual auction at the Feeding Hills Congregational Church, 21 N. Westfield St., Feeding Hills, MA

The auction will setup at 6:30 and get underway by 7:30 at the latest. This is Western Massachusetts largest auction, usually with over 100 buyers and sellers attending. All amateur radio and computer related gear welcome. Please mark all items clearly with your name/call, minimum bid (if desired). The HCRA takes 10% of the sale, up to a maximum of $10/item. For quick sale and ease of the auctioneers, please box small miscellaneous items and mark the contents on the outside of the box.

Also at the auction is a great raffle prize, a Yaesu FT-817 multi mode/band radio. Tickets will be available at the auction for $1 each or a book of 6/$5. Admission to the auction is free and it is of course open to the public.

Further information can be found at: http://www.hcra.org/November%20Auction.htm or can be had by contacting me directly at: kk1w@arrl.net or by telephone at 413-245-3228.

'73 and thanks for reading this, hope to see you November 1st!

Jim, KK1W

Mike,

In my haste to help with your problem, I neglected to ask you to clarify something.

Your postings have focused on low audio, but I interpreted this to mean low signal as you were referring to the RF amp. Are you getting good AGC (S meter) action?

I checked a unit last night with the scope for gain in the RF amp stage. I had the same results as you. The difference between pin 8 (input) of the RF amp board and pin 11 (output of the RF amp) was about x2.

Scott M

Message-ID: <p_yt9.71091$La5.211694@rwcrnsc52.ops.asp.att.net>
Source record: 37516

Greetings,

I have decided to sell a Collins 32S-1, 516F-2, and 75S-1 all in very good cond.

Transmitter is very nice, front panel, cabinet, and chassis look great. Does need some rehab in the vox circuit
as the resistors have changed value. It has full output on all bands, but audio seems to be muffled.
Checked the audio amp tube and it checks out OK. So I would assume that alignment and or relay cleaning
would be in order. I also have the original manual. Ser. # 1355

Receiver is in very good cond also like the xmtr. It does have a couple light knicks in the trim ring.
It works very well, nice audio and sensitivity. No filters other the standard SSB filter. I do not have a manual
for this receiver. Se. # 1771

516-F2 is a much later P.S. MCN# 3548. I bought this from a surplus store a number of years ago and they shipped it in
the cabinet. So I mounted it in a nice winged emblem cabinet, no speaker. It is in perfect cond.

I will also include the interconnecting cables. I will properly box and ship insured via UPS for $950 in the
lower 48. Can provide jpgs upon request, but will take some time to get them done.

Thanks for the Read
Dave K9UX

3094. National SW3 Info/Part needed

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-10-23 16:04:35 UTC
From: donlk@webtv.net
Message-ID: <16158-3DB6C893-34@storefull-2172.public.lawson.webtv.net>
Source record: 37517

I have tried to find the dimensions and a description of the RF control knob, pot and bracket for an SW3 on several other radio sites hope it works here.
The set I have is the Ac version with 58 and 27 type tubes. The whole assembly is missing but I can fabricate one with if I had an adequate description. This is the vertically mounted pot with a portion of the knob extending thru a slot below the main tuning dial I cannot determine the needed info from the pictures I have found on the net.
Need:
Knob diameter and thickness.
Type of fluting or Knurling on knob.
Exact dimensions of bracket.
The pot itself is not a problem as I have several old 10 K pots that will work and look more or less original.
Of course I would be elated if someone had these parts and was willing to part with them. It would sure save me a lot of bother. Just dreaming!
Thanks

3096. Re: FT-101 Low Receiver Gain

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-10-23 17:27:11 UTC
From: deWA7ZPU@aztec.asu.edu
Message-ID: <90a0ea69.0210230927.44ac7d86@posting.google.com>
Source record: 37519

Hello,

John S. MacKay said that he has a FT-101 with low AF gain and suggested a preamp mod. The primary problem that I have is in the RF/IF. However, when that is fixed, I may still need the audio boost. Without your suggestion, I would not have known that that was a potential problem. I have read the details of your fix on the metrovan group.

Dan/W4NTI suggested that FT-101s were often modified for CB and were peaked on 11 meters to the detriment of everything else. Before I started trouble shooting, I re-aligned the receiver.

Scott M. asked if I was sure that I had low RF/IF gain and measured his FT-101 and confirmed the the RF amp voltage gain matched mine.

All of your suggestions are greatly appreciated. I did some more testing last night.

I could easily be convinced that there could be more AF gain as well, and now I have a fix for that. However, I base the low RF/IF gain conclusion on the fact that low to moderate signals don't create any AGC change. My expectation is that on 20 meters the natural noise should start to bounce the S meter and that once a signal can be easily copied, it is definitely on the S meter. That is not the case on this radio.

So, now that the RF stage has been verified, I have another stage that I am concerned with. This is the final (3 mHz) IF amplifier, a CA3053 integrated circuit. Both the input and output for this stage are low taps on coils. A 40 db gain is specified for this stage. However, I can't even see a signal voltage on the input when the output is at a 2 volt signal level. However, if I measure the gain from the top of the input coil to the output, I get a gain of 5 for an output of 2 volts, and a gain of 25 for an output of 0.5 volts. During this measurement, I disabled the AGC. Since this is a cascode circuit, I suspect that the 2 volt gain may mean that one of the transistors is saturating, but even the gain of 25 seems low to me.

I had hoped to substitute another CA3053, but I haven't found one locally. Tonight, I will build the equivalent to a CA3053 out of discrete parts and substitute it in the circuit.

Can you see any reason that that won't be a good test?

Any other suggestions?

Thanks,

Mike WA7ZPU

3098. Updated Tables for Heath TC 2 tester Wanted

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-10-23 18:07:24 UTC
From: thompson@mindspring.com
Message-ID: <ap6o8c$9bp$1@nntp9.atl.mindspring.net>
Source record: 37521

I have asked several times but maybe they don't exist. I have the original tube charts and the updates through the 1978 book (its on Bama too). However test data for tubes such as the 5AR4 and 6EH5 are not found. I tried the later IT-21 settings but they don't work.
If you have a chart that shows either or both of the tubes let me know via e-mail to thompson@mindspring.com. I hate to keep borrowing others tube testers plus the TC-2 tests 1U4 and 5's that many later testers don't.

Dave K4JRB

5AR4 is easy... just look for any comparable diode with the same pinout.
Try the setting with a good tube. Adjust the shunt until you get the
right transconductance reading, then use that setting with other tubes.

6EH5 is a bit harder. First try looking for 12EH5, 25EH5, or 50EH5 types
on the chart, although I wouldn't not expect to see them. Then start
looking for other types with the 7CV pinout. Plate is set to 11K, and again
set the shunt until a good tube reads properly.

Hello,Tenho,

I have a working Hallicrafter S53A, but Iï¿½m not aware of the details you
are speaking of. I am going to check it, but I have the receiver in the
week-end home, so Iï¿½ll post or e-mail you on next Monday (I will go
there this week end, itï¿½s a village near Madrid).

I have only a general coverage receiver for checking the local oscilator
(no scopes nor frequency counters iun the week-end home) but I think it
will work.

Best regards,

Juan Albaladejo
Madrid

Folks
Having just found a cherry Heathkit GC-1A receiver on Ebay I find it is in need of parts.
Unfortunately, this means I have to find a replacement for the AF115
<whisper> transistor
<coughs nervously to hide embarrassment>

I guess I could try and track down NOS units but is there a modern replacement?
Advice appreciated - I am UK based.

Thanks

Adrian

Hello Dan. Here's my local info: The R-388/51J-x cabinet is a fairly heavy, steel cabinet with notable square corners. It will also have cooling slots in each side and many have a flip-type top. I've seen/have both. The side rails are indented and are threaded. There should also be a typical nomenclature metal tag on the top lip with the Collins logo, etc. The R-390 cabinet is sort of a noticeably rounded-corner affair and are generally painted gray (like the receiver). It carries a MIL "CY" number (my book is put away just now or I'd look up the p/n) and the beast has shock mounts on it (or there should be 4 holes in the bottom where they would normally be). My original R-390A cabinet is aluminum. I'm sure, however, that either hams or official entities have stuck these things in all manner of cases, over the years. Maybe this will help you. Regards de K3HVG

Recently picked up an SB-104 from an SK estate sale, however no one could find the power cable. I need either a complete power cable or at least the plug. The plug looks like an 11 pin tube socket (about 1.25" across) with a metal cover with cable clamp on the back side. Thanks for the bandwidth.

Joe,
Thanks for the info on the web pages not working. Had problem before.
It's a combination of something that happens on the web page server at
Tripod and the browser the client is using. Few months back IE 6
wouldn't access sub-pages,
but I'm using IE 6.0.2600.0000 now and all pages display OK.
Would be interested in what browser and version you're using.

The $15.00 packing charge applies per order (not per item), but we'll
waive it on small items, such as modules, probes, power sensors, etc.

Thanks again,
Al

3110. FS: Yaesu FIF-232C CAT

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-10-24 02:44:01 UTC
From: Gleason Sackmann <gleason@edu-cyberpg.com>
Message-ID: <Xns92B0DD25E7B7Dgleasoneducyberpgcom@216.168.3.44>
Source record: 37533

I have the following for sale:

The Yaesu FIF-232C CAT is an outboard interface system required by some Yaesu models for interfacing the radio to a serial port of a PC. The FIF-232C converts TTL levels required by the radio to the RS-232C levels required by the computer. There is an input jack on the front and a PTT input jack on the right side. The front panel also has a power On/Off switch and a power LED. The rear panel has a RS-232C DB-25F connector. The FIF232C includes the required cable to most applicable Yaesu radios. However, the user must supply their own standard RS232 serial cable from the Yaesu FIF232C to their PC. This is a standard cable obtainable from most computer suppliers. You will need to note how may pins (such as 9 or 25) on our your serial port to obtain the correct cable. The FIF232C is 4x2x4 inches and operates from 117 VAC. Computer control software IS NOT included. Some of the Yaesu models that require this interface include: FT-650, FT-736, FT-747GX, FT-757GXII, FT-767GX, FT-840, FT-890, FT-990, FT-1000D, FRG-100, FRG-8800 and FRG-9600.

I am asking $35.00 +$10.00 S/H

If you are interested, please contact me.

Thanks.

3111. FS: Kenwood TS-520 SSB/CW transceiver, Works great

I have for sale the Kenwood TS-520 80-10 meter transceiver. It works great and looks very good. The front panel is very clean and looks like new. The knobs are shiny. Sensitive receiver and that smooth Kenwood audio. Comes with AC and DC power cords and the manual. Will be carefully double-boxed for shipment. Here is your chance to buy an excellent and reliable transceiver for a very reasonable price. I'm asking $225 plus shipping. Thanks for looking.

Stephen,

Is this for an existing osc, or are you building one? If the latter, design around a 1Mhz and divide by 10 usinf a decade counter or a 4Mhz and divide by 2, again by 2. this gic=ves 1Mhz and then divid by 10.

Hope this is of help.

I especially love the use of "VACUM TUNNERS". The Bird dual
directional coupler without any DC leads or slugs and the high voltage
lead going through the unbushed hole in the back panel are a nice
finishing touchs.

My 1949 ARRL Handbook has a full page ad in the back for the "New 2.0 Mc" IF system so there would be "No IF Images" on the ham bands covered. Looks like the Hallicrafters Co. changed the IF from 455 Kc to 2.0 Mc some where along the line. 73 Sparks W4EAS

But this radio uses a 455 kc IF.
This problem reminds me of something I ran into on an S-108 (I think it was). Someone had strung the bandspread tuning capacitor backwards and the 0 and 100 points were reversed. As a result it didn't want to align properly.
Just a thought...its worth checking.

Source record: 37456

Hello,

The rest of the story ...

I substituted a component built version of the CA3053 last night and it worked the same as the original.

However, I got to thinking more about whether I have an RF/IF problem or an AF problem. More than one of you folks had questioned that. If you remember, my determination that it was RF/IF was based on the AGC or S meter.

You many also remember that I said that the FT-101 was heavily modified. Every board that I looked at had various components added and traces cut. Where I checked them, the modifications seemed to be upgrades of the older boards to look like newer boards and seemed to be well done. So, I pretty much ignored the changes.

However, after I started doubting my RF/IF vs. AF low gain conclusion I started reviewing the AGC circuit upon which I based my conclusion. I found that it had been modified. It looked like the purpose of the modification was to change the fast AGC into a slow AGC. However, a couple of key components were changed that affected the AGC sensitivity. First a 100K resistor was changed to 1M. That reduced the AGC sensitivity by a factor of 9. Then a silicon diode was substituted for a germanium diode which changed the AGC trigger level by 0.3 volts. I modified the circuit back to the original, and weak signals just touch the AGC threshold now. Of course, I still have low speaker output, but now I know where to add the AF stage to fix that problem.

Thank you all so much for the help.

Mike WA7ZPU

Hello all,

I'm interested in modifying my Swan 1200X to run on 6KD6 tubes as opposed to 8950s. I've heard from several sources this is possible. Does anyone have the instructions for this modification they could send me? I am also interested in hearing about any other mods available for this linear.

I would be happy to pay for an copying and mailing costs. Thanks in advance.

Anyone know what the Signal/One Milspec-1030 went for?

I'll be refurbing a Signal/One and I wondered what these are worth?
Mine isn't a 1030, it's a high serial number CX7A.

Also, anyone out there with leads to manuals and parts for Signal/One
transceivers.... I mean, integrated stations.

If it is really blue in the glass it's OK, but if it is purple all
over the plate or within the system it's bad.

For a discussion on this topic with good advice look at

http://groups.google.com/advanced_search/

Search for "purple glow" in the group "rec.audio.tubes".
Then look especially for posts from Patrick Turner, Fred Nachbaur,
Nick England and Andrew Cowley.

Kind Regards, Eike

I lost a good 6AQ8 that way. If I can't find a setting I don't want to risk testing it. The only exceptions are say a 12BQ6 which used the 12 v setting and the rest of the 8BQ6 settings. You are right none of the EH5 settings are on even the latest 1978 chart. I have to borrow a tester for 6EH5, 6aQ8, 6BN8, 5AR4/GZ34, 6EH5, and 50EH5 (in my Dow key TR switch). I just can;t believe that Heath never published settings for about 25% of tubes made from 1960 to 1970. Guess they wanted to sell the newer testers.
73 Dave K4JRB

For what it may be worth (or not) an acquaintance of mine used the rig in the Marine Corps and said that they did not do well at all when used "tactically". By that, he meant if you moved it from one location to another.....hi!! I had an early Signal/One (or whatever the model was back then) and it was a terrible rig. I had to keep a drawer full of compression trimmers around for spares.

I paid about $3 ea. for 9 and 11-pin connectors at Surplus Electronics, Beltsville, MD. Ask for the owner, Bill. I'm not certain what he has in stock at the moment, though. They are listed as relay sockets. As far as hoods, go, you may be stuck with the folks from Nebraska. Hamfest price in DC for the hoods is .50-$1.

> Steve W2ZR

Thanks Steve,

$4550? It'll be $10K in a few years. A restored SX-115 went for
$4,000.

I didn't know it was possible to seach completed auctions. I'll play
around later tonight.

It was CX7A two weeks ago, I'm the buyer. I received it today. I gotta

tell you. WOW! I'm doing hand-flips. I'm break dancing.

You guys with your S-Lines and 30S-1s, your 75A4/KWS-1s, HT-32B and
SX-115s, NCX-5 and NCL2000s, R390 CE200V CE600L. Your KWM-380's. Ha.
This monster is the king of the boatanchors!

It's gonna take a lot of work and many hundreds of dollars for
parts to get it working but then, this is it, the maximum-radio, the
uber-rig.

This CX7A has multiple problems but most of it is there. It's a 8 on
cosmetics. Looks like problems in the power amp and the power supply.
Does not have the optional CW filters.

Got some strange mods on the back panel but these were done without
cutting metal. For example, an umbilical comes out of the rear
keyjack. Blower is missing.

Hello to the list,
A while back someone sent me a blower for my amp. I had a massive virus attack, and lost his address. Will you please contact me and we can finish up. Sorry for the inconvenience.
wb6vse@ipa.net

Thanks

Makes sense. They didn't make that many so the bugs didn't get worked
out.

I'm familiar with Heathkits and even there, where they did runs of
thousands, there are weakpoints. The LMO was so close, another
man-year of engineering and maybe 10 bucks in parts, and it would have
been perfect.

I'm restoring boatanchors and don't mind the effort of keeping these
antique radios working.

> model MT-33N
> FCC Dataset 20A-5

This is a Progress Line Mobile, T-powered (large brick sized heatsink
on front panel). Receiver should be a 4ER25 series, and the
transmitter is a 4ET20. Single 6146 final good for about 30 watts
nominal, 35+ watts with a new tube.

High band -- 152-174 mHz. Receiver has to have caps added to get the
RF stage to tune to 2 meters, TX will tune directly, no modifications.
Later models have a 'gold' plated chassis. I have copies of the
manuals if you are interested.

>
> Motorola Twin-V Radiophone
> model T43GGV-7
> Transmitter type: TA136

This is a competing model to the above, with a nice narrow 10" case.
TX and RX strips are "G" series. Single 6146 final, same power output
as the Prog mentioned above. Vibrator supply.

High band --- 152-174 mHz. Receiver needs caps to tune to 2 meters,
transmitter should go without modification.

>Sure glad I don't live next to that guy...

Hmmm. Hang a multi-turn loop on the side of your house, hook it to a full-wave rectifier bridge using fast diodes, and at the very least you could keep your gel-cell batteries charged up. Might even be able to run your lighting, or even go off-grid entirely.

It would be tough to only be able to cook or shave when your neighbor keyed up, though.

Its meritable of you to point out an unfair charge but people have to spend time packing and use materials (eg. tape & box) and if they don't have plenty of that laying around they have to buy it. I shipped some stuff recently and had to buy those styrofoam peanuts and they were not cheap and I double boxed and that ate up many yards of duck tape which also eats up money and I spent an hour of my time and four corrugated cardboard boxes to ship two items. I didn't charge for that. Lots of commericial catalogs will give minimum orders or shipping and handling charges that may cover their costs or more. I don't care for the gouging either. Guys who deal on eBay have a chance to ask questions of sellers and I'd not hesitate to query a seller about why his charges seem high. Or, just don't do business with the seller. "Gaming" the system is not that uncommon. I had an electrician do some work on my house and caught the guy billing me for an hour of work for an item that he actually spent only 15 minutes on, and for another item of work (same day, same visit) that also only took 15 minutes to do, bill me for another hour of time, and on another item he said "I'm going to give you X" and in my life the word _give_ means give for free, but he billed me two hours of time for that, too. I got overbilled another time in my life and argued for and got a price reduction based on the notion that the guy not only way overestimated the time he'd need to do the work but was taking a per hour fee much higher than reasonable, too.

If shipping involves carrying the box down to the pickup point, this is going to take some time out of the guy's life. Twenty minutes one way plus twenty minutes packing, addressing, etc. a box all adds up to an hour of time. You do a few of these each week and pretty soon you are feeling ripped off because you're not getting paid for that time.

A $9 fee with $2.25 actual identifiable costs seems a little high to me, too. I'd figure a $5 fee for time & materials & postage as more reasonable.

UPDATE

I still have to clean out some of the stuff in the shack. I have WAY too
much stuff after 37 years.

OK here is what I have, all in good condition and complete except as noted.
Some have been spoken for as noted.

1988,
1994(GONE),
1995,
1996,
1997,
1998,
1999 x march,
2000 x december(GONE),
2001 x january(GONE).

I'll send these to anyone who wants them for shipping. The last time I
shipped QST's the cost was about $5.50/year with the postal rate hike.
If anyone wants a year or all years let me know. Make me a shipping offer
on all if you want.

I also have about 5 years of QEX that I'll let go for shipping. (GONE)

Soon they have to go out. If you know a club or school that wants them that
would be great. I'll also try the local library and school first, but
failing that, unfortunately its to the trash.

Interesting - it's OFTEN British Columbia where the amateuir radio
thievery comes from.

I wonder if this is all the same guy using fake names.

It was VE8AA / Chris Pringle last time (what a name eh?)

Have you tried contacting the Royal Canadian Mounted Police office in
Prince Georges?

I am VERY wary of sending any money to Canada for things nowadays.
You hear so many stories like this from the B.C. area.

Be advised...the USPS is tightening down on used boxes. Before they
simply prohibited boxes that were marked 'bleach' or other hazardous
chemicals (like beer), but the new posters in the PO say ALL previous
markings must be obliterated on any re-used box.
The hardware store next to our local PO is making a bundle rewrapping
packages in plain brown wrapping paper for 50c-$2.00 a pop. Thats still
cheaper than buying the PO's boxes!

3182. Heathkit GR-78 Battery

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-10-25 19:40:43 UTC
From: "Gary \"Joe\" Mayfield" <gary_mayfield@hotmail.com>
Message-ID: <urj7jga5c6g407@corp.supernews.com>
Source record: 37406

I'm restoring a GR-78. Fortunatly someone removed the battery years ago. I know the original battery was a NiCad (I plan to use one too). I can also tell the battery is "split" in other words charged as two batteries, then used as one battery. Does anyone know how many cells this battery has? A first guess looks like 4 cells on each side. In other words an 8 cell / 10 Volt battery. This sounds odd so I thought I would ask if anyone knows for sure.

Thanks,
Gary

John,

Yes, my old germanium power transistors are dead.

I located a set of 4 on ebay for $5 plus about $3 shipping. However, it is not absolutely clear that these will work since they are not exactly the same. They are Motorola 224331. The FT-101 application is not at all critical of gain, etc., but could be a killer with high instantaneous currents and voltages. So, I won't know if they work until I try them, and then I still won't know how long.

The fellow that I bought them from claims to have more. His email address is rwf99[at]juno[dot]com.

I still have to finish the AF preamp, check out the transmitter, re-align the whole thing, and then I'll get to those transistors.

Thanks,
Mike WA7ZPU

AM-6155/GRT-22
Linear power amp, 225-400MHz, 50W out (conservative) 10W in, Eimac X651Z/8930 final, extensive metering, can be converted to 116-150MHz, rack mount 7" high, 80 lbs, ITT (model 3212), Part of AN/GRT-22.

This Amp uses Emiac X651Z/8930 in silver-plated cavity-drawer; 175-turn TUNE counter dial. Main chassis has solid-state power supply and buffer amp/mulitplier; panel meter monitors voltages. Requires 105/120/210/240 VAC 50-400 Hz and +20 V req 60 ma. +20 V keyed; 7x19x18.5, 80 lbs shipping weight.

The HV Supply from AM-6155 is Loaded with GREAT parts to include a 1752V at 270ma transformer, 8HY 300ma choke, 100K ohm 95 watt resistor, 2x5mfd 3KVDC capacitor, & rectifier circuits card.

One ham has used a 4CX400A (available from Svetlana)to raise the output power to 450 Watts. Others have reported that you can run the 8930 (electrically identical to 4CX250R/7850W) at about 400 watts on 432 Mhz...

Used - Excellant Condition (NOT TESTED) $295.00 plus shipping from zip 31088.

Email if you have any questions.

73,

Larry Keith, KQ4BY

I hadn't thought of that! You are exactly correct!

Whether it's $20 for an item and $80 for s/h, or the opposite, the buyer still
pays $100. But the seller pays eBay a lot more to sell an $80 item!

>>
Your point is well taken, but it still comes down to whether the seller makes
it clear, up front, what the s/h will be. I have passed up many an item because
the s/h was too high. If enough of us do that, the practice will stop.

It's probably just my dumb luck, but I've never had a bad deal on eBay (knock
on wood).

A Clemens SG-83C comes to mind... Small, covers 50 kHz to 54 MHz,
solid state, well made..... But very scarce. I have two I use on the
bench
regularly. A SG-8 Heath with a dedicated counter is credible for vintage
sets--but lacks the 50 kHz region.

>this way trough the whole span of the band.

RCA's first commercial consumer superhet radios, the Radiola 25 and R-812 and maybe some other models, used this "second harmonic" system. ISTR the purpose was to avoid radiating the LO signal back out thru the antenna. Since the IF was only about 50 or 60 KC, the antenna circuit would have certainly passed a lot of QRM back out!

If your dial calibration reads right and the set aligns with good sensitivity, then it must be what Hallicrafters wanted. Interesting to know. We don't always give Halligan's boys credit for such ingenuity. --Mike K. AA1UK

Funny. I once got an SX-25 like that -- BS tuning worked really smooth, that guy must have been proud of his dial stringing job. Maybe you have to restore an Atwater Kent 1925 set to get the part about 100 being the low end of the dial :-)

I traded that set off, now have another SX-25 that's strung right. 73, Mike K. AA1UK

I have a working (mostly) GR-78 that the previous owner replaced the NiCad with a Radio Shack NiCad, which works great. I'd have to iopen her up and look to see what model battery it is, and how many cells. Yes, it is tapped or split.

Heath may indeed have used the strange voltage and no. of cells. I have the manual (in various zeroxed sections) and could probably figure it out, but I bet someone else answers your questions first.

BTW, the top band (dual conversion) doesn't work, even though both local oscillators seem to be running. Anyone got any ideas?

Also, some of the bands have terrible calibration tracking, which can be fixed by replacing the padder caps with larger values (like 0.1 uF!). Is that normal for this unit? 73, Mike K. AA1UK

The designer died a number of years ago. The widow still has the patent and would not let it go - hence, none available except used.

Idea: Go to the patent office and do a search. You can build one for yourself - as long as you do not sell it.

Nobody else ever got a similar antenna "off the ground" and yes, they were of reduced size. They worked FB on 75 and 40. Suppose so on the other bands too.

..... and when it ceases to be fun - it is time to move on!

Source record: 37422

I have a clean and working SB-101 station including the SB-600 speaker with the HP-23 power supply inside of it, Electro-Voice 638 microphone, HM-102 SWR Meter, set of reprinted manuals and a few spare tubes.

Was on the air last evening on 75 and 40 meters with it. Not tested on the other bands - as I don't operate on them.

Shipping will be expensive, but I'd drive a few miles to deliver or meet the buyer. I am near Albany, NY.

Asking $225 plus shipping. Please reply by email - thanks.

Bill

3199. WTB: Manual and papers for H500 Trans Oceanic

Newsgroup: rec.radio.amateur.boatanchors

From: Jim <barrie@eos.net>
Message-ID: <B9DF7C2A.184EF%barrie@eos.net>
Source record: 37423

I built a GR-78 and still have it. It sat unused for almost 30 years. When I decided to see if it would work, I found the battery exploded, but did not leak. I just cut it out of the circuit and am running it off an external Radio Shack regulated 12v supply, The battery had two 12V sections so that they could charge it from 120vac. when the AC voltage was applied, the AC voltage from the secondary of transformer T501 was fed through two diodes on alternate cycles (D501 & D502).

My top band has NEVER worked. And the sensitivity on the other bands was always poor. The BFO is almost none existent. On the plus side, it is rock stable.

I found one of these guys in some roadside trash about 10 years ago. I
never tried rigging up a battery supply but it worked right off the bat
with a little jury rigging. I thought it performed pretty well once a
decent antenna was connected to it but it sure seemed to catch a lot of
line noise.
Turns out my AC xfmr was leaky!
After fixing that it received wonderfully in spite of many reports to
the contrary by other users. But it won't do squat with the whip
antenna...no big surprise there.
I totally replaced all the electrolytics on the main board on top a few
years later and that cleared up the poor audio. There were LOTS of bad
caps and I suspect that might be the case for anybody who still has one.
I agree with Jim on the stability. No problem copying 20m SSB with it.

One of the CX7s went at a local hamfest earlier this year for 125 dollars. Didn't function; he said it was probably a switching diode. He did have the manual and schematics, but he didn't have the schematic changes for the LED display that he designed. It looked like a good rig.

All of the 32V series transmitters used what Collins called "St.James
Grey".

Spray cans of St.James Grey can be obtained from Surplus Sales of
Nebraska.
They advertise in almost every QST.

I looked up the 3CX1500A7 tube just for kicks. My book only goes to
the 3CX1200A7 and it takes 7.5 volts @21 amps (157.7 watts) for the
filaments and 5000 volts @800 ma on the plate, 4KW input! Three of them
would run 12 KW input with an output of 4500 watts. The number after the "X"
on these tubes always depicts the plate dissipation and which approximates
the output, not actually, it just figures out that way. This moron selling
this furnace, is going to a 3CX10000......It is an expensive way to heat his
house. Guess he doesn't know what the amateur power limits are....he's
probably a xxx anyway and doesn't know the difference between 5 watts and
5KW except for two letters.

What a wanker. Can you not see that the original submitter posted
from an American domain? This was not a foreign national making an
effort to post in another tongue. We really have no need for
tolerating illiteracy or ignorance without pointing it out, nor is
there a thing wrong with one electing anonymity on USENET. Funnier
still, your own post shows that you may have your own literacy
problems. What is your native language?

FOR SALE:

Beautiful Lafayette HE-45B transceiver for 6 meter AM.
A very desirable classic radio.
15 watts to a 2E26 final tube. Modulated by a 7868
Built-in both power supplies for 120V AC and 12V DC.

Excellent condition. No rust, dents or scratches.
120V AC operation with built-in speaker and many other
nice features. Has 1uV sensitivity, noise limiter etc.
Fully operational. All original knobs. No modifications.
Dimensions 12-1/2" wide X 5-1/2" high X 8" deep.

This one is in showroom condition and comes complete with
manual copy, including schematic and parts list etc.
Comes with a brand new crystal for 50.4 MHz installed
and ready to go.

Will sell for $85.00 plus shipping

E-mail me for a picture or to arrange purchase

Maybe it's a leftover from the S-53. The S-53 has an 2.075 Mc IF, which is right near the lower edge of the B band. The S-53A was changed over to a 455 Kc IF. I fixed up a S-53A last year, and I thought it had a rather interesting design, and I didn't even catch the oscillator harmonic trick. The radio has a two stage IF and a pentode mixer with a seperate triode oscillator, rather than the noisy converter tube Hallicrafters used in their other mid price recievers. There's no RF amp, just a single tuned circuit between the mixer and the antenna. Sort of an odd combination. A low noise, high sensitivity radio with minimal image rejection. And my S-53A had images all over. Much worse than a S-38. I'll bet it worked out better with the higher IF. I have no idea why they changed the IF frequency. Also, I don't know how they got theS-53(no suffix) AM broadcast band to track in the same direction as the higher bands. It's not a bad radio, though. It was less drifty than the other mid level Hallicrafters radios I have.

Always happens when you comment on other's grammer or spelling.
And the wanker that you are, you did find the one misspelling.

So, how exactly did you devine the nationality of the earlier
poster? How can you tell that english is his native language?
How can you tell that he is a competent typist?

Oh, it doesn't matter to you does it? You just like to get
your rocks off being intolerant.

Enjoy,

-Chuck

for sale:
case top cover for one of the larger National radios (?); item is
straight, typical gray color, paint has some scuffs & some scratches,
a couple pf which go thru the paint. dimensions are about 16 5/8" wide
by 14ï¿½" front to rear; one of the f-r edges is rolled, and the edge op-
posite the rolled edge has three screw holes, w/ a slot traveling f-r
close to the non-rolled edge. on (what i believe to be) the inside of
the cover are two paper labels; one (torn) is the "Standard Form Warran-
ty" label (w/ "National Company" at the ripped bottom), the other one
(ripped in half) has "Radio Corporation of America" at the top, "Hazel-
tine" in the middle, and "National Company" at the bottom.
anyone know what this it to? it is for sale, i will take some pix &
post to the website later tonite.
tnx in advance,

Hi Michael,

I had a look at your boat. Don't you think a cat (although faster than a monohul) is more difficult to sail fast in high waves??
The sea is not like a pond and with the little knowledge that I have I thin that this hull (in the 30 ft LOA region) may be difficult
to make high speeds in rough weather conditions with high waves (over 1.5 mtrs height).
In any case have you tested the hull in your test tanks with high waves??
How does it behave?? Any test results available??
Finally, I believe that this hull needs a face lift (jazz it up a bit, the bow section needs a lot of improvement) so is appealing to the eye.
I am involved in manufacturing and selling ribs in Europe, if you have performance tests of this hull I will be very much interested to see them.
Do you think that it may interest you to try this hull for a RIB (ONLY if is fast and steady in very rough weather conditions??)
Please let me know
Best Regards
Manos

AM-6155/GRT-22
Linear power amp, 225-400MHz, 50W out (conservative) 10W in, Eimac X651Z/8930 final, extensive metering, can be converted to 116-150MHz, rack mount 7" high, 80 lbs, ITT (model 3212), Part of AN/GRT-22.

This Amp uses Emiac X651Z/8930 in silver-plated cavity-drawer; 175-turn TUNE counter dial. Main chassis has solid-state power supply and buffer amp/mulitplier; panel meter monitors voltages. Requires 105/120/210/240 VAC 50-400 Hz and +20 V req 60 ma. +20 V keyed; 7x19x18.5, 80 lbs shipping weight.

The HV Supply from AM-6155 is Loaded with GREAT parts to include a 1752V at 270ma transformer, 8HY 300ma choke, 100K ohm 95 watt resistor, 2x5mfd 3KVDC capacitor, & rectifier circuits card.

One ham has used a 4CX400A (available from Svetlana)to raise the output power to 450 Watts. Others have reported that you can run the 8930 (electrically identical to 4CX250R/7850W) at about 400 watts on 432 Mhz...

a quick search kicked out plans to use the amp on 144, 220, and 431 MHz as well as other mods..

Used - Excellent Condition (NOT TESTED) $295.00 plus shipping from zip 31088.

Email if you have any questions or would like to make an offer!

73,

Larry Keith, KQ4BY

> Have a nice weekend
> Tenho

Tenho,

I have checked the local oscilator range of my S53A, and my conclusions are exactly the same than yours : in band B (receiving about 2.5 to 6.5 Mhz) the oscilator is just running at half the frequency that it should be logical to work, so the 2nd harmonic is being used for receiving this band. The rest of the bands seems to work in the normal way (I have not been able to check it in 52 Mhz because my receiver, a Sony ICF-7600D does not go so high).

Oscilator tube in my S53A is the 6C4 original, and the circuitry has not been changed or tampered.

Really, it is very strange. I donï¿½t imagine why Hallicrafters people designed the oscilator in that way!!

Perhaps someone with experience in restauring Hallicrafters could explain us the reasons of it.

Best regards,

Juan

Jan, you can make a cable with connectors very easily by using male
and female banana plugs. I'm sure everything is available at Radio
Shack. I,ve been running my 210x for years on a home made cable like
this on car batteries.

3281. Schematics and tech info needed for old tube CB's

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-10-28 02:54:46 UTC
From: Ed - VA3ES <va3es@rac.ca>
Message-ID: <Il1v9.766$qD2.208078@news20.bellglobal.com>
Source record: 37352
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.cb

Hi All;

I'm in the process of restoration and 10M-conversion of three tube-type AM CB radios:
The first is a Pierce-Simpson "Guardian-23,", and the second unit is a "Cardon Spitfire", (which is identical to the Robyn T-123, and very similar to the Kris 23). The last is an oddball - a Canadian made "Chisholm GRS-1566"

I'm missing schematics and other technical info for these radios. There is suitable info in Sams CB series CB-35 (Robyn T-123) and in CB-8 for the Guardian 23. Would anyone have either of these Sams books, or any schematics/service info for these rigs? I'll gladly pay for copies of the technical info.

Thanks, and vy 73,

Ed, VA3ES

writes:

>The designer died a number of years ago. The widow still has the patent and
>would not let it go - hence, none available except used.

Aren't US patents only good for 17 years? If the MorGain antenna was around in
the '60s or '70s, the patents are long expired by now.
>
>Idea: Go to the patent office and do a search. You can build one for
>yourself - as long as you do not sell it.

Tried that - no luck. A search on "morgain" did reveal some designs on an
Italian website! The auto-translation is almost as hard to understand as the
Italian original.

>Nobody else ever got a similar antenna "off the ground" and yes, they were
>of reduced size. They worked FB on 75 and 40. Suppose so on the other bands
>too.

What I've gathered is that they were half-size on the lowest band. Probably not
too efficient on that band, either. But a "160 meter" MorGain would be the size
of an 80 meter dipole, and might work several bands. Worth looking into?

Anyone have any 3 inch diameter stock no 14 or 12 wire @8 TPI? Trying to build link tuner. Thanks 73s Lew KlNDV

3289. Need help with Galaxy V xcvr

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-10-28 14:13:35 UTC
From: k5dh@raytheon.com
Message-ID: <jCbv9.1574$Bd4.11872@dfw-service2.ext.raytheon.com>
Source record: 37362
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

I bought a Galaxy V xcvr and remote VFO at a hamfest
this weekend. Didn't get a p/s or a manual with it,
although it does have the crystal calibrator and VOX
units installed (I've been told they were optional).
I know they made a plain Galaxy V, a Mk.I, a Mk.II,
and a Mk.III model. How do I tell which one I have?
I've never messed with any Galaxy gear before. The
front panel and the label on the rear panel just say
"Galaxy V". I'll need a manual, but I need to know
which one to beg for. :)

Thanks and 73,
Dean K5DH

3290. Need parts for Heath MT-1 Cheyenne

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-10-28 14:16:49 UTC

Anyone have any ideas on how to do your own
silk screening of homebrew projects and even
more on restoration of older equipment. Dry
transfers don't make it and it is many times
impossible to find the fonts and sizes required.

Anyone have any experience with this that you can
share with those of use who are in the dark on this issue?

Thanks

Toilet paper tubes are too small. Go to the medicine chest and check out
pill bottles; there are a lot of 3" diameter ones and they are great as
a coil form. Ask the local motor rewinder for a handful of wire if you
don't have any sitting around. Put waxed paper around the bottle, wind
the coil carefully, then apply Q-dope to the thing a few times. Remove the
bottle and the paper when the dope dries.

If you don't have q-dope in the garage, dissolve some styrofoam cups in
acetone until it's thick and gooey. Works nicely. Measured DA is just
as good as the commercial stuff.

Dear Michael,

In addition to my message of yesterday regarding your 'DUOLOGY' concept I had a look at the site and can comment as follows (without prejudice, this is a personal opinion):

The concept has potential, however as claimed it may slightly outperform conventional designs slightly on paper, but will not be practical for general use. It generates lift to get the hull out of the water, however if at all effective this will only be in ideal conditions (water, load, balance) and driving in a straight line. The concept relies a lot on the balancing of the craft - put some weight in the nose and it will be a dog to drive. When operating in surf conditions the hull will tend to 'bow steer', and may also be prone to a lot of cavitation when fitted with a single motor, as the hull will aerate the water in front of the motor. From a handling point of view this hull would have sluggish manoeuvrability.

The concept works on roughly the same principal as the Hysucat - a hydrofoil supported catamaran - which was developed in SA around the 1960's, and has yet to be proven successful.

Looking at the price tag this guy wants for his concept of USD 45 million ... no comment ...

Think about it.

Best Regards
Manos

Thanks to all for your comments and special thanks to Juan for his
experiment on his S-53A. I figure the news are good and bad: the good ones
are that the S-53A was originally designed to use the 2nd harmonic trick and
my receiver works as intended, the bad ones are that the design of the
frequency display needs a major change..:-(

I have had great results restoring Drake panels using three color silk screening. I have scanned the panels into Photoshop and separated each color into it's own layer. I touched up any scratches and faded lettering. I then created a screen for each color and print the panels over a three day period.

I buy most of my supplies from:

I've got some Galaxy gear here. The 'Mark' models will say so on the front panel so yours is apparently an original Galaxy V. Tubes in the VFO, right?
I have a manual copy here for the 5, VFO and PS but its 40-odd pages and I have no way to make free copies. I could mail it and you copy and return it or whatever.
Plus I've got two junker rigs (if you need any parts) and three good power supplies and a station console..any of which wouldn't mind a new home.
If your VFO is 'virgin' and hasn't had any mods I need some information from it.
Tnx,
Bill WX4A

> >

Hmm, I see no reason this would be "dirty". The unit used a crystal controlled oscillator and a high q bandbass filter for it's output stage. As far as for quality of signal if it were used for communications, that would depend on the circuits used to key it in CW, or generate the SSB signal.

I suspect that the buyer would strip out the oscillator circuits and configure this as a straight linear amplifier, driven by his transceiver. As such, it would make a fine clean amplifier. Add some LC circuits and a heavy duty bandswitch, and you have a typical amateur radio linear.

Health hazard??? You must be joking. My Collins 30 S 1 is in the same grade and I dont for a minute fear the RF from that.

Now if I were to get my carcass across the HV Plate power supply.....
that would be a health hazard :-)

Steve

From: Norman Franklin <normanf@pacbell.net>
Message-ID: <3DBF204E.E087918A@pacbell.net>
Source record: 37391

I'm in the process or bringing my old HA-700 back to life. I had
lost the operating/service
manual so I had to order one from A.G. Tannenbaum. I'm using a simple
long wire for an
antenna. I believe I have a low receive sensativity problem. I need to
have the RF/IF gain
full to get almost any thing. The S-Meter dose not move much past 1 for
any received
signal. I've not had the tubes checked but they all glow. For what
ever that is worth. I'm
assuming the problem is some where in the RF or IF stages of the
receiver. But not sure
how to check it out. The receiver may just need aligning. Are there
shops out there that
do this kind of stuff. I do not have access to a RF signal source. The
main question I have
is where should I start looking.
Thanks in advance

Source record: 37389

The top band is dead on mine, but I did see another one for sale at a radio fest and all bands worked.

Sensitivity on mine is so-so with the whip antenna. Audio stinks, same as with the Mohican I had earlier and traded for the GR-78 (big mistake -- the Mohican looks a lot better!).

One ridiculous penny-pinching design defect in both the Mohican and GR-78 -- the bandspread tuning is only one gang of capacitor, and tunes the LO only. So the farther you tune down the BS, the further out of tune your antenna and mixer stages are. Bottom of any band on the bandspread is pretty dead!

So I use the BS only as a fine tuning control.

Source record: 37390

The Hampden County Radio Association will be holding it's annual auction at the Feeding Hills Congregational Church, 21 N. Westfield St., Feeding Hills, MA

The auction will setup at 6:30 and get underway by 7:30 at the latest. This is Western Massachusett's largest auction, usually with over 100 buyers and sellers attending. All amateur radio and computer related gear welcome. Please mark all items clearly with your name/call, minimum bid (if desired). The HCRA takes 10% of the sale, up to a maximum of $10/item. For quick sale and ease of the auctioneers, please box small miscellaneous items and mark the contents on the outside of the box.

Also at the auction is a great raffle prize, a Yaesu FT-817 multi mode/band radio. Tickets will be available at the auction for $1 each or a book of 6/$5. Admission to the auction is free and it is of course open to the public.

Further information can be found at: http://www.hcra.org/November%20Auction.htm or can be had by contacting me directly at: kk1w@arrl.net or by telephone at 413-245-3228.

'73 and thanks for reading this, hope to see you November 1st!

Jim, KK1W

<< The main question I have is where should I start looking. >>

I'm not familiar with the HA-700, but if Lafayette used any of the mechanical contrivances that were used in the HA-63, here's a remote possibility....

I bought a beautiful HA-63 on Ebay, which reportedly had low audio. It did, among other things.

The receiver uses spring wire to hold the tubes in place. Each end of the wire gadget goes through the chassis, straddling the tube. Under the chassis, the spring-wire ends have a simple bend (hook) to prevent it from being pulled through the chassis. I found the hook of one of them tangled in the capacitor and resistor ends on one of the tube pins. It's worth a look.

Hi,

I'm in need of assistance in repairing the power supply in my Wavetek 3001 Signal Generator. What I'm looking for is the schematic for the power supply. I have a maintenance/repair manual but the ps schematic does not match the ps in the unit.

My generators ps uses discrete components for voltage regulation and only has 1 voltage adjustment pot. The schematic shows voltage regulators(LM395 & LM317) and 2 adjustment pots.

If you should have the schematic I'm looking for I would appreciate a copy. Thanks

Hi Gary,

Follow this link http://www.gwengibson.com/order.html to a source for photo-ez silk screen. The sheets are pre-sensitized and only require exposure and rinsing to make a screen. I use ink jet transparency sheets (works best with pigmented inks)to expose the screen. For small projects like radio logos, I use artist's acrylics in squeeze bottles and business cards for the squeegee. You can get by without a frame on smaller stuff or make a quickie frame from mat board. Keep the unexposed sheets in the fridge.

3339. Looking for JUNKER Hammarlunds

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-10-31 13:10:54 UTC
From: Al Link <K4ICL@Charter.net>
Message-ID: <us2b0bmsdfa9d@corp.supernews.com>
Source record: 37262
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.swap

Looking for junker Hammarlund transmitters and receivers from the 1960-1970 era, the more modern looking gear. Models might include the HQ-180, HQ-170, HQ-100, HQ-110, and HQ-145 series. Also HX and HL series transmitters.

By JUNKER I mean radios usually needing repair and/or servicing or may be, otherwise, in non-working condition and have appropriately LOW prices!

Please email with descriptions and/or pictures.

Cheers,

AL
K4ICL@Charter.net

3340. Need a Hammarlund var cap

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-10-31 14:31:45 UTC
From: Mark Goodwin <goodwin@adi.com>
Message-ID: <3DC13E95.5000904@adi.com>
Source record: 37263

I'm restoring a Hammarlund HQ-129X receiver and need to replace the C21 crystal phasing variable capacitor P/N SA-604. The shaft is broken off.

I'd appreciate any leads on this item from availability of NOS to a "parted out" old chassis. Thanks.

Mark Goodwin

Hello all:

I recently acquired a KDK FM 2033 2 meter xcvr
Works great but I am missing the Operating Manual
Does anyone have one or can send me copies of the above would be greatly
appreciated via E-Mail would be great
The frequency programing is the main item
Thank you in advance

Didn't I write you once before offering to copy the info for said radio? IF interested, will do for $7.50 shipped. That will help cover mailing cost to you in Canada as well as copying costs. Let me know. International or US Postal MO will do, should we go through with any deal.

Have only been able to visually check the tubes. Have not found a local
place to test them. The one place I knew had a tube tester said they do not
test customer tubes. They said their tube tester is unreliable. I'm still
looking
for a place here in the South Bay (San Francisco) A.K.A. The Silicon Valley.
It is good to get support for a similar train of thought. I figure it must
be in
the RF section since the S-Meter gives a very low reading even on local AM
broadcast stations.

I bought an HE-80 receiver new in 1964. After about ten years use, it
was deaf as a post. The tubes were still good (and still are good,
going on 40 years!), but the receiver needed a realignment desperately
at that time.
A realignment restored it to life. Maybe they used poor quality coil
forms.

I'd be willing to bet they have been set up so that they cannot be
modified. Marine VHF is a 'consumer commodity' so usually is
engineered to be pretty secure.

Ham companies are just about giving away 2 meter HTs (Icom has a decent
5 watt HT with tones and everything for $99.) so, unless you want the
intellectual challenge, there is not much of a point in modifying a
Marine VHF for the ham bands.

Unless Motorola re-used the number, the HT-220 is at least thirty years
old. Those handie-talkies were among the first 2meter FM walkie talkies
that hams used, getting them via surplus markets. The conversion
information would have been published at the time.

Capacitors in the range pf 5 to 500 mFd would not be ceramic, but electrolytic, which makes me suspect at least some of them may be mmFd, not mFd. I recommend you recheck the parts list.

The HT220 predates all of that, but whether the HT220 is useful depends
on which boards are in it. There are several different versions for
different frequency splits, some of which can be tuned down to 2M without
much work, and some of which are not. Crystals are available from QMX
Crystals.

Any crystal house can make you one for a reasonable price if you tell them the frequency, the loading capacitance, the package and whether you need series or parallel resonance.

International Crystal Manufacturing and JAN Crystals are probably the biggest outfits. Cuemeks Electronics at 888-678-9825 are cheap and can do some odd stuff for less.

Try Cuemeks Electronics at 888-678-9825. I think they were $15 a pop
the last time I ordered any. They knew all the parameters for the 220
offhand so I all I needed was the model and the frequency.

3371. Designing a B+ supply

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-01 22:23:54 UTC
From: markt@mindmodel.com
Message-ID: <3dc2feca.315576164@news.prodigy.net>
Source record: 37195

I have a good working design for a B+ supply. I am thinking about offering them as a kit, complete with a box that looks like a B battery with the exception of a cord coming out for power. The idea is to have a neat, safe replacement for the "B" battery in some portable radios/equipment.

I have a few questions:

1. Would you rather feed 110vac into the "battery" with a regular two-conductor line cord, or would you prefer that it was fed using a wall transformer with relatively low voltage like 12vac?

2. What about the filament supplys? Would you like this same battery to have a separate output for filament voltage, or should that be a separate box (looking like an "A" battery for instance)?

3. What is a reasonable maximum current for the filament suppply?

I will keep you abreast of my progress on this, and several of the other newsgroups.

73,

Mark W1EOF

Hi,

I have several pcs in stock of the 6C4C valve from Svetlana. This is the same as 6B4G. The valves are very well built and looks identical to NOS Sylvania. They are made probably somewhere between 1960 and 1980 The price is about $ 41.- each. Picture and data at my web site www.demostenes.no

3374. Tube info on 572B

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-02 00:26:31 UTC
From: Edward Knobloch <e.knobloch@verizon.net>
Message-ID: <3DC31BB4.C50DD194@verizon.net>
Source record: 37197

Hi, Gang

I'd like to know who designed the 572B power triode.
Was it United Electron of Newark NJ?, some ads said UE-572B.
For that matter, I know there was once a 572A,
which was the tube originally provided with the Hammarlund HXL-1 linear,
but I have never heard of a live specimum of a plain vanilla 572.
Has anyone seen one?

Early ads for the 572B called it the 572B/T-160L.
Does that mean that Taylor tubes made them, and rated them as 160W plate
dissipation?
Why the "L" designation? - that would imply a low mu tube, but the 572B
was a high mu tube.

Enquiring minds want to know.

73,
Ed K4PF

From: Dale Parfitt <parinc@verizon.net>
Message-ID: <3DC35977.59BAF29D@verizon.net>
Source record: 37203

Anyone found a reasonable source for the 2 multi section cans in the R-4C? I know of Antique Electronics for at least one of them- but at $30, a little pricey.
I guess the low voltage one at least could be gutted and 2 new ones inserted inside.
Tnx,

Dale W4OP

Source record: 37204

Dale,

There are some other alternatives but they are generally considered unacceptable by Drake enthusiasts. I'm the exception, hi. What I've done in the past is to replace the electrolytics with larger ones, in terms of physical size, capacity, and voltage rating. It involved switching the front/back positions of the two caps and putting a piece of insulation between one of them and the noise blanker to avoid problems. At least that was my solution. Not sure if I have any of those caps left or not. But, at any rate, it is considered a modification and as such most people don't want to do it.

Sorry I can't help you out with a source of caps. You might, however, try QST. Not sure if it was the November issue or not but there was a little clip about a company that has started making multi-section electrolytic caps. And don't forget the swap nets!

Enjoy those Drakes.

73s,

Evan

Cross-posted to:
rec.radio.amateur.homebrew,rec.audio.tubes,rec.audio.marketplace,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

Hello,

PC 900 is a B7G base triode with a heater of 3.9V 0.3A, Va is 135V
Vg -1V Ia=11mA Wa 2.2W Ik=20mA max, u=76 and the gm is 14.5mA/V
A very promising valve to experiment with in low-level stages, both
audio and HF/VHF amplification. It was developed for use in VHF and
UHF television tuners. The low heater voltage makes it very easy to
use in an ordinary 6.3V heater system, just use a dropper resistor of
8.2 ohm 2W and you are very close to 3.9V

I have 400 pcs in stock and I will sell them at only $ 5.00 each or
$ 2.50 each if you buy 100 pcs or more. The valves are NOS, in mint
condition, original boxes and the label is Haltron, but they are
rebranded, and probably made by Philips or Siemens.
Have a look at my website www.demostenes.no and e-mail me if
interested.

Best regards,

Arnold Goks&#65533;yr

For sale:

Tempo One HF transceiver.

240W tube-powered watts of SSB and CW.
80, 40, 20, 15, 11m and 10m bands.
Many features. VOX, PTT, ANL, Calibrator, RIT.
120V AC operation. Built at the Yaesu Musen factory in Japan.

Bought new in 1976 for $535.00 - previous owner kept it in remarkably
good condition for its age. Has original receipts.

Good working condition. Nicest one I have seen in ages.
Comes with the original manual and a hand microphone
that was supplied with it.
Will sell for $225.00 plus shipping

Tempo AC/One power suuply/speaker console for the above radio, with
connecting cable. Excellent shape - will sell for $125.00 or for
$75.00 with the above radio.

Digital frequency display for the Tempo One
Mattco model 745. Connects via SO-239 connectors.
Will sell for $125.00 alone or for $85.00 with the above radio

I also have a Shure 444 desk microphone that is wired for the
Tempo One, and in very nice clean condition.
Ready to go for $45.00

>1. Would you rather feed 110vac into the "battery" with a regular
>two-conductor line cord, or would you prefer that it was fed using a
>wall transformer with relatively low voltage like 12vac?

I'd rather have the AC line cord go right into your box, though there are fewer insurance and safety issues for you if you use a wall-wart.

>2. What about the filament supplys? Would you like this same battery
>to have a separate output for filament voltage, or should that be a
>separate box (looking like an "A" battery for instance)?

ISTR some old portables used an all-in-one battery that had both A and B. Even when not, I'd like the option to buy your box with "A" built in. Two separate boxes, with two line cords or wall warts, is messy.

Have you posted this rec.antiques.radio+phono, where it will be more effective?

>Thanks Don W5QXK

That's a very rare amp.
However, rarity alone doesn't determine value, demand does.
The Eldico transmitters and receivers bring a fair price since they
are sort of a copy of the Collins S-line.

I suppose that someone with an Eldico station who wants a complete
setup might pay a lot for your amp, otherwise anything from $250 to
$500 might be a fair price. With something this rare, there's no
consistent market price.

From: "owen.home" <owen.home@ntlworld.com>
Message-ID: <x68x9.634$oL4.50330@newsfep1-win.server.ntli.net>
Source record: 37147

Help
I'm trying to identify the manufacturer of an early oscilloscope, the only info on it is a logo consisting of an M with a CRT schematic symbol running up the centre of the letter and the model number is B100.
The unit is very primitive consisting of an L shaped chassis with the CRT, which is missing, apparently completely exposed but resting on a half circle channel at the top of the L and the only controls being brightness and focus on a panel at the foot of the L. I think it's basically just a power supply with direct connections to the deflection plates on screw terminals at the back so it may not be an oscilloscope but an AM modulation monitor as there's no timebase shown - unless they were external then?
The spec plate specifies 110-245volts AC at 50 Hz so it could be British/European.
Any help/ideas or clues as to maker or type numbers for early CRTs would be useful - I want to get it working!
Thanks
John

METERS

Nice round voltmeter with keystone face appears to be from a General
Radio Company RF voltmeter. Scales calibrated in VHF 0 - 0.4 and UHF
0-2 with a dBm scale up to +4 DBm.
Made for 2-/14" round hole. Great looking meter. Ideal as spare part
for your test gear. Will sell for $5.00

Phasetron 0 - 300 A DC, new meter in box. Yes, it's NOT 300 mA!
Needs shunt. Has black case and is 3" in diameter.
Very nice looking. Available for $8.00

Tiny meter - black. Looks like antique type. Dimensions 1-1/8"
diameter
with mounting hardware for 1" diameter hole.
Two are marked 0 - 12 X 1000 FT. The other reads 0 - 1.
QTY 3 available for $3.00 each

6A DC meter by Prime Co. of Ohio. Rectangular face dimensions 2.25"
wide X 1.375" high.
Overall dimensions are 2.25" wide X 2.375" high.
QTY 1 only for $2.00

E-mail me for pictures

Probably a model 100, I had a few a LONG time ago.
Only problem with the WU machines is the stop bit is
a long as the data bits, so they can have trouble
syncing up at times -- although mine worked quite well.
Nice little units, if it is the 100.

Pete

<nico.vandongen@compaq.com> writes:

>I've been offered a 1939 Hellicrafters Sky Challenger receiver.
>Can someone tell me if this is something special from a collectors point of
>view and what a reasonable price is for this receiver when in good
>condition?

According to Chuck Dachis' "Radios by Hallicrafters", the "bible" of Halli collectors, this set is the S-15 and was introduced in 1936. His price guide (I emphasize "guide") liasts it as $100 - $150. It has 9 tubes and is a good basic receiver, with tuned RF and two IF stages and BFO. There were fancier Halli's of this vintage, but this set has the distinctive full circle rotating dial and black front panel, and any Ham radio this old that's in good condition and not modified to hell and gone is fairly rare.

Chuck's book has a warning: some models of S-15 have the bottom and front panel as one L-shaped piece of metal, making it "most inconvenient" to get inside for repairs. Check that out before you buy.

Oh yes, there's an S-18 "Sky Challenger II" intro'ed in 1938. That may be what's being offered. It's about the same, but the bandspread is calibrated and there's a separate image rejection tuning circuit and dial -- a real novelty and quite useful if it works. And no mention of the hard-to-open cabinet. This set would be worth having for the unusual image rejector. Valued at $145 - $195. I'd grab this one.

Generally, with HQ numbers of 120 or higher, the higher the number, the more recent and better is the receiver. The highest is the HQ-180, a very fine radio. The 170 is very similar but ham-bands only. I believe the HQ-160 was the first dual-conversion, but 140 and 150 are good too.

All these sets have six bands, unlike some later, cheaper Hammarlunds. All Hammarlund receivers are easy to work on underneath (well maybe not the Super-Pro models, but the HQs are laid out well).

There were no "really cheap" Hammarlunds -- all had at least a tuned RF stage and two IFs, and some kind of selectivity aid -- xtal filter, Q-multiplier, or tuned IF bandpass. You will be happy with any of them. --Mike K. AA1UK

The exception I believe is the HQ200 which doesn't come
up to the HQ180s in quality...

I was at a hamfest this weekend and saw about 4 nice looking Hammarlund
hq-140? hq-160 I forget the model numbers...I would like one of these
and
to be able to use it also...I have plenty of local help to restore one
but I
would like to hear which models might be better than others.
Google searching never got me a complete list of which models exist.
does anyone know?
Thanks Rob

Let us know what you find out.

There are endless bits of history that should be captured before they
vanish.

What happened at the end of Signal/One. I ran into a guy at a hamfest
who said that Signal/One turned into a scam.

What happened at the end of Heathkit? How did they close it down?
What happened to unsold kits and parts?

What happened to that the station that had 36 elements on 20 meters?
Is that antenna still up?

3460. WTB or trade GRC-109

I have a Learadio model RH-4 Junior Unihand Reel
with mounting brackets... I believe this was used
on the Stinson L-5... It is in excellent condition...
It currently does not have the wire, but can put
some on the reel...

I need an RCA AVA-120 reel, which was used on the
Aeronca L3Bs and The Piper L4s... Would like to
make a swap... Or am willing to but an AVA-120,
if anyone has one...

Thanks

What tubes do you need? If it's just the finals, it's easy.

Antique Electronics Supply and Triode Electronics both always have good
prices on standard off-the-shelf tubes.

The HQ145 was also a dual-conversion receiver, as was the HQ215. The HQ215 was a solid state unit that had intermod problems. What was that super fancy unit, with the gold plated bandswitch? The Pro 310 or something like that? It had a drum type of dial, like the Collins 75A receivers. A friend of mine had two or three of them, and sold them several years back.

If you look at the schematics on the single conversion Hammarlunds, they are almost identical. The only differences are for the additional features. I have the HQ-150 and it's unique in that it has both a crystal filter and a Q-multiplier. It's a very versatile radio. I recommend it unless you want a dual conversion receiver.

Hello All.

Has anyone replaced the innards of the Bath Tub Capacitors used in AR88s?

The "lid" appears to be soldered on and will probably need a lot of heat to unsolder it with risk of setting fire to the oil filling, melting the aluminium casing, or melting the insulation around the tags. I'm tempted to use a "can opener" to remove the back and replace the guts with polypropylene capacitors. The back could be left off, as the chassis will cover the opening.

Any advice?

Thanks

>up to the HQ180s in quality...

Yes, I think that was a very late tube model, similar to the one with the
built-in CB transmitter (not a joke, wish it was).

I don't think the original poster needs to worry about the PRO-xxx unit with
the drum dial -- it's a rare collector's item and pretty expensive.

Should mention the Super-Pro sets -- the SP-200 and -400 are nice, with their
continuously variable selectivity, but are old, big, and heav-vy! The 600 is a
great set, but with no bandspread tuning or built-in calibrator. Also heavy
and harder to service. I like mine, but when the day comes that I have room
for only one Hammar it will be the HQ-180. 73, Mike K. AA1UK

THAT, is the one that I want Brian. My 129X coupled with the Q- Multiplier is a dynamic duo. I just got my 140X, I'm still 'going over it'.....but I think the 129X is a better piece, but that's just my opinion.

It seems the 140X isn't a well put together as the 129X. You'd think with it being newer that it would be a little better, but I just don't think that's the case.

Does or has anyone else had the two above mentioned receivers, and can they give me their opinions. I think I'm going to have to get the 140X tuned up, I was a 'little' dissapointed. :-(

Hello,

I'm hoping that someone here could help me out. I just picked up a very nice Hammarlund HQ-200. The radio seems to play very well, but it does have a low level buzzy hum (with a little scratchy sound) in the audio. It is not terribly loud, and can be covered with moderate levels of AF gain. The hum does not really change with any of the various functions of the radio. Thinking that it might be power supply filter caps, I soldered in some new electrolytics in parallel with the exisiting can type. No big improvement noted. I tried swapping the final audio tube with another, but it made no difference. Any ideas on where to go from here? Or perhaps some hum is to be expected. One other HQ-200 owner I contacted suggested that no hum was the norm. Thanks for any help.

Bill,

Well I'm asking now, the design is not cast-in-stone. The B+ supply will definitely by adjustable and regulated from about 15vdc - 120vdc at up to 100ma. I'm not sure about the filament supply, I'm collecting feedback on what people require. It's also looking like I may have two supplies, one that is strictly line powered and another that has is rechargable off of a wall-wart so you could truly "go portable."

Source record: 37116

What type of "listening" did you have in mind??

If it's UTES and HAMS then the higher priced 180's and 170's would be a good choice...

But it want to listen to the BBC, HCJB, VOA, Radio Netherland, DWRadio or Radio Bulgaria or other mega-watt services, might I recommend the lowly HQ-100.

Here is some good reasons for my choice...

1. It's cheap
2. It's smaller and less intrusive
3. Uses common easy to find tubes
4. Low parts count - easy to fix and align
5. With clock - it makes an excellent alarm
6. Works great with a 5' antenna

I have both a SP-600 and HQ-180 in the radio room but I spend most of the time on the HQ-100 because it's in the bed room. When reading a book, I can reach over and flip it on. I wake up to the BCC everyday and I even listen to the local (AM) ball games on it.

The best radio - is the one you use everyday!

You might want to also consider a Hallicrafters S-38C D or E as well. Millions were sold for the same reasons above.

Not the best - but good enough for basic shortwave broadcast listeing.

Message-ID: <Oj4y9.1036$iQ.82915@newsfep2-win.server.ntli.net>
Source record: 37142

I have recently acquired a UHF version of the BC221 Frequency Meter which covers 85 to 1000MHz. This particular model was tropicalised in 1945 so is a wartime unit. I previously asked about the TS-174 (same item, but 20 to 250MHz) but it seems to be quite a rare meter.

Does anyone have any information on the TS175 or indeed what equipment it was used with.

My knowledge of wartime comms is limited, but I don't remember coming across much equipment that operated above 250MHz and certainly not upto 1GHz. Radar was around 450MHz, but after the Klystron was invented, was this frequency still used?

Any help would be much appreciated.

Thanks

Graham

If the exisitng electrolytics are leaky, parallelling new ones will not be the same as having good caps in there. Try disconnecting the old ones. Besides, if the old ones are leaky, they are drawing supply current- possibly eventually destroying your power transformer.

I find that the audio of the HQ-180 is horrible for AM use and are the most expensive of the H-line (excluding certain SP-600's). I much prefer any of the others I have in the collection for "short-wave" listening. These include the HQ120/140/150/160 and the HQ-145. I've never had a 129x, for whatever reason. I guess the the HQ-160 is my favorite, followed closely by the 140 and 150. Either of these 3 can be had at a reasonable price and are readily repairable should the need arise.

Graham, I use a quite large "old-tyme" American Beauty iron that will heat the whole bottom up such that I can tap the case and dislodge the solder (don't splash it on you!). Its not a nice chore getting the guts out, either, but it can certainly be done. Maybe I'm not quite the esthetic-prone person, however, as I generally replace the doubles and trips with a terminal board and modern caps. If you've ever see how the Canadian AF modified ARC-5 receiver capacitors, that's how I do bathtubs. Good luck OM.

The HQ 180 is too selective so it sits on the shelf. My HQ 150 is lacking sensitivity and is on the pile of boatanchors on the floor. My favorite boatanchor rcvr now is the Hallicrafter SX 42, and the SX62A in the office but mostly for the FM.

I'm looking for a xtal oven I believe it's 6.3 volt with what I was told was a td9 xtal holder, also need a 100 to 125kc xtal. also does anyone know where I can get 8 pin plugs similar to tube bases?

Thanks Jake

Depends on what you want to do.
Earlier single conversion models suffer a bit from imaging on the higher frequencies. I have a beautiful HQ150 that works very well and I live with an image or two with it. Just plain like the old receiver. Pretty much the same with my HQ100A. The HQ180A gets a lot of use on AM and I like it on all modes. It is not perfect on any but an overall very good general coverage receiver. If I really want to hear AM I use one of two National HRO 50T1s that have exceptional audio from the pair of 6V6s in a Williamson configuration.
For ham bands the HQ110 is probably the best bang for the buck you can find. Dual conversion is a big plus on the higher bands 10 and 15. I used to use an HQ110 for 10 meter AM work and used an old Ameco PCL-P preamp ahead of it. It provided good gain with reasonable noise and also gave another tuned stage out in front of the receiver. The Ameco used 6CW4 nuvistors. Made a nice compact ham band receive set up. The HQ100A is the same size as the 110 but single conversion general coverage. Also good bang for the buck in todays market.

Number one thing to know as a Hammarlund owner is 6C4s. Have plenty of them. They can cause all sorts of problems. Mostly hum modulation on the higher frequencies and also drop out/loss of the highest frequencies. Any time I have a strange problem other than the above I go to the 6C4 first since it is easy.

Watch for bargains on Hammarlund receivers. I think HQ150s HQ110s and so on are under priced in todays market. HQ180s are over priced. Just my opinion.

Hello,

I have the following for sale.

I will not ship but I will deliver within a reasonable drive from
Smithfield, RI 02917 or meet you half way or you can pickup.

Cash only.

Digital photos available.

Qty. (1) - Motorola R390/URR contract 14214-PH-51-93, serial no. 4757

Works fine. Top and bottom covers, SO-239 ant. Connector,

Power cord replaced. Dial lamp not working.

$275.00

Qty. (1) - National NC-183D

Works fine. Audio transfomer replaced by Hammond unit.
Sounds great.

Speaker included.

$225.00

Thank you for reading.

Paul Mendes

Any crystal manufacturer can make you one. ICM and JAN Crystals are
two popular ones. If this is intended to go into the oven above,
you can consider just getting an oven off the shelf and ordering the
crystal for whatever holder the oven you can get has.

>also does
>anyone know where I can get 8 pin plugs similar to tube bases?

Octal plugs are no problem. Newark and Allied stock them.

How well does your 42 do on FM, compared to the 62? Is it sensitive enough up there? I have one with low sensitivity (but working) on all bands, clearly in need of new caps and screen grid resistors.

The 42, like the SP-600, is a great radio if you have a roommate to help when you have to move it. --Mike K. AA1UK

Well, even the HQ-100 has an RF amp, 3-gang tuning, and two IFs, right? The trouble with S38 "AA5" sets is they will pick up the major SW broadcasters just fine, but the image response is so bad that you get the "utes" for free -- RTTY and Morse on top of your news and music.

And only Hammars have the clock radio function :-) --Mike K. AA1UK

If you align an HQ-180's 60 KC IF strip by the book -- meaning on the tightest
CW selectivity setting -- and then open up the bandwidth switch for AM, the IF
response shape might not be good at all. I used a sweep generator and scope on
mine, and tweaked it for the best AM response, the heck with CW, I have other
BAs for that.

However, the response will still not be very broad, so for "hi fi" treble you
probably want a radio without that final low-frequency IF.

BTW, the SP-600 has really good audio, though it could use another BW of around
5 or 6 KC.

Hi Gil!

This may sound weird, but the Ten Tec Century 21 CW transceiver has
the same knobs. Check with Ten Tec and you may get lucky. At last check,
they still carry some parts for the 21 .

I have 2 Century 21s and a Drake t4xb paired off with an r4 receiver.

73 for now.

>What type of "listening" did you have in mind??

My passion is 60 meters, that's my favorite, because it's the toughest IMO. I have never really did the ute 'thing' even though I am familiar with it, maybe that bug will bite me one day.

Then of course, the major shortwave bands. Followed by the BCB.

I've got the BCB covered with the 129X, and actually it is pretty good on 60 meters also, which surprised me. But I am trying to 'figure out' the strengths of the 140X, I know it really sounds great on the hams, it's not as good on the BCB as the 129X.

I think I'm going to have 'no choice' but to get the 150 and possibly the 180. ;-) I really like that the multiplier is built into the 150....that's sweet.

I don't think "bad or horrible" are terms interchangeable with
"excellent selectivity". IIRC, it will open up to 6kc wide on AM which
is ample for communications quality audio. To "fix" it would destroy
it.
There are better choices if all you want is a kitchen radio for easy
listening. To wit, Hammarlund had lesser quality receivers too but you
won't hear that broadcast station in the Andes of Peru on 4768.2 with
them :-)

My 2c.

Me too! It is what I use for SWL out in the shop and for
listening to BCST AM. When I listen to the AMers on 160/80/40 the
HQ-150 is always one of the rxs online. The other is usually a National
or an R390A

> If I really want to hear AM I use one of two National HRO 50T1s that have exceptional
>audio from the pair of 6V6s in a Williamson configuration.
>
The 50T1 was a real surprise, I'd always heard about HROs but
never owned one. A friend sold me this one for $100 after I worked on
some of his gear. Its been re-caped and tweaked and it lives up to its
reputation.

>For ham bands the HQ110 is probably the best bang for the buck you can find.
>
>
I never had one of these either but worked on one for a friend
and grew to like the little set. When I was back East for my job I
picked one up at the FAR/Fall Fest for $25. It needs work but hopefully
it will work as well as the one I did for N6XT.

>Number one thing to know as a Hammarlund owner is 6C4s. Have plenty of them.
>They can cause all sorts of problems.
>
When I reworked my HQ-170A/VHF a few years back the 6C4 osc was
one of the tubes I had to replace. After the set was aligned and working
it developed distortion that got worse with increased signal strength.
It was the NIB RCA 6C4 osc tube! The tube was 5ers on the TV10 tester
but wouldn't work in the ckt. I tried the rest of the 6C4s from 4
sleeves of 5 tubes and that was the only bad one. 1 out of 20 and it was
my 1st pick.

3526. WTB: Microphone cable

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-07 01:19:15 UTC
From: k9sqg@aol.com
Message-ID: <20021106201915.00185.00002303@mb-de.aol.com>
Source record: 37048

I'm trying to find a source for high quality microphone cable, 2-3 or 4 conductors, shielded, flexible, and easy to work with. Have found sources that sell it in 100-500 ft spools but that is a bit too much.

Thanks for reading the posting.

Evan

Nah, the wife is super with my hobby, but she'd draw the line at having a
Hammar in the kitchen...lol...actually I'd draw that line.

We've got the Kloss Model One in there for that. :-)

I woldn't say the HQ-180 is expensive to fix. No oddball tubes. The only
thing that might be hard to replace would be one of the 60 KC IF cans, compared
to the usual 455 jobs. --Mike K. AA1UK

I'm not so sure where it was said that 'fixing' an HQ-180 to have poor selectivity in exchange for AM fidelity was an option. I think we are barking up a non-existing tree.

There was an SAR receiver, with a built in spectrum display that covered a range of something like 38 to 1000MHz. I believe that it was the APN/4Y, and that it used plug-ins to determine the range. It was prominent in the Fair Radio Sales flyers from the Sixties.

3535. CQ magazine on Joe Walsh

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-07 12:22:24 UTC
From: "ckh - Too Much SPAM"
Message-ID: <hdwX38NCLQJC-pn2-TcfTVT92Zppd@localhost>
Source record: 37057

I saw the current issue at the office.

Joe Walsh, guitarist for the Eagles, "Hotel California", has been bidding on boatanchors on eBay.

The article implies that he paid $4,000 for an SX-115 and an SX-88. That's $4,000 each.

He says that these radios will never sell lower although he thinks the economy and eBay have peaked.

That's my assessment too. The economy has been unwinding since the DJIA turned down on January 14, 2000, prices overall are soft.

Boatanchors, especially the premium brands, are yet to reach anything like proper pricing.

Good boatanchors will increase in value. They will double and triple in value over the next few years.

I've watched a couple "Antique Roadshows". Their "experts" have convinced the public that some pretty weird, useless stuff is worth a fortune.

A recent episode featured a lumpy ceramic, made in the U.S., not "Ming Dynasty" or "Ancient Greek", that was priced at thousands of dollars.

I know a fellow who makes cast bronze statues. These are "new" collectables that sell for tens of thousands of dollars.

Contrast that to a Tektronix 485, a Collins 75A4, or a Central Electronics 200V.

Come on. You can tell me, it's ah6gi/4. How many of you have seen "Antique Roadshow" and thought, "$15,000 for THAT! That's an ugly wood table."

Think about how much fun you'd have with a KWM-2 and a 30L-1 or (in my case) buying a DOA SB-303 and spending a couple hours every evening, cleaning and fixing it. After you have it working well, listening to 75 meter LSB or the shortwave broadcasters on 40 meter AM.

Ugly wood table or 75A4?

lumpy ceramic or TR-4?

Look at a Tiffany lamp or harrange the gang on 75 meter LSB?

You can't leave this stuff in the basement or garage. You have to clean it up, replace the caps, burnish the contacts, work the controls and bring it back to spec. Put it on the air and tell everyone that you're running the NCX-3 again.

Joe has been a record-setter on ebay long before the economy went bad.
He can do that.

Ok.

So where's the beef? That it raises the expectations and prices for
everybody else?

-Bill

The R8B, mainly because I don't turn the tube stuff on unless it will
be on for at least 3-4 hours. But, my favorite all time receiver is
the SP-600, best band cruiser ever manufactured,IMHO!

Hi, Harry,

I've had good success with International Crystal Mfg. in Oklahoma City. You can reach them at (800) 725-1426. They also have a Web site at http://www.icmfg.com/. Just let them know the frequency range you wish to cover and they will do the rest. I've purchased a number of crystals from them for my R-4B / T-4XB and have been very pleased with their quality and service.

I think the SX 42 and SX 62a are the same on FM, buy mine are in different locations. One in the radio room at home, and one in the office.. I don't exactly have a plan for the antenna for either - - im just using a few feet of were and using them on FM, rather than the ham station antenna.

Nothing on it. It's a floor model. all 250 pounds of it. Rolled paper.
Rolled paper is still in it. (yellowed of course.)
Flip up hatch to load the paper. teletype slids out on a tray. Right side is
bias and other components. Underneath at the rear a rectifier unit for
multiple voltages. Transformer is with it. Seems to be all there. Has
"Western Union" on the right side on a plate 7X4 inches.
If nothing else cool looking unit for display. Looks like it may work.
Keyboard looks 30's or 40's...thats all I have on it. If you know where to
look for the model let me know.

Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap

Leader Model LSG-11 Signal Generator.....$50 plus shipping

This unit has six bands covering 120 kHz to 400 MHz. It also has the capability of being used as a fixed frequency unit with the addition of a crystal. The frequency adjustment has a very nice vernier dial. Their are jacks for audio input/output and RF output. If you are restoring old radios, a signal generator like this is a necessity on you work bench. This unit has been checked out on my bench and works great. The unit is in excellent condition. Also includes a copy of the manual and the test leads. This unit is from the late 1960's and is superior to Eico and Heathkit signal generators of the same vintage.

Here is a photo: http://members.cox.net/radiostuff9/leadersiggen.jpg

Also parting an SX-96 - no cabinet or main/bandspread tuning knobs. S-meter is working but cracked face - good Hallicrafters logo

What do you need?

Check my feedback on *bay for a reference. User ID: n7rk

Thanks for looking,

Dave N7RK

Hi all...

I'm still trying to find some of the original radio
equipment for my airplane (an Aeronca L3B "Grasshopper")...

The specific equipment I still need is:

RCA AVA-120 Trailing wire antenna (will trade Learadio RH-4 for one)
General Armature AG-40B Wind generator
RCA AVT-15A Transmitter and Remote Control Unit

Any help would be appreciated

I take it that, it is because it is bad for the tubes not to be fired up for a specific amount of time?

I also read that when warming up the HQ's that you should set the receiver to .54-1.32 (what's the reasoning behind that particular group)? Also to have the 'sensitivity' turned all the way up (I think I understand that one) and the volume cracked.

I don't think that there is a specified amount of time, but it is hard to turn the tube receivers on and turn them back off a short time later. That is how the life of the tube is shortened, power ups.

Never heard about being on the low end of the b'cast band for power up.

Many times, if I'm going to be around the house for a few days, I'll leave the tube gear powered up for that time frame.

It's two things. Going from dead cold to red hot puts a lot of stress
on tube filaments. In a sense, a tube is only good for a certain
number of turn-ons. Light bulbs are like that too, that's why they
say to leave the lights on if you'll be back in a few minutes.

It's not because, "the light bulb uses a lot of power to start and
you'll save money on the electric bill by leaving it on."

It is true that there is a current surge when you turn on a radio or
light bulb. The duration of the surge is too short to affect your
bill. The problem is the thermal shock and the possiblity of breaking
the filament.

Lightbulbs generally burn out in a flash when you turn them on.

The other problem is the switch. That's only good for a few tens of
thousands of on-off cycles. Switches really take a beating.

Everyone has had an electric wall switch go bad. It's a nuisance to
repair but those are only 49 cents. It's a much bigger problem when
you have replace a power switch on an antique radio, especially if it
is integrated with a volume pot.

> I also read that when warming up the HQ's that you should set the receiver to
> ..54-1.32 (what's the reasoning behind that particular group)? Also to have the

>

Don't know why that would be.

You could cycle an antique radio using an external switch, like on
a powerstrip. That would reduce wear and tear on the radio's switch.
I would still cycle the radio's internal switch a few times a month, to
keep the contacts wiped.

Even better would be an external "soft-start" device. The ultimate is
a Variac, bring the voltage up slowly over 10-15 seconds.

I have a commercial, relay based "soft-start" in my SB-200 linear amp.
This helps protect the hundred dollars worth of tubes in the amp.

I suppose someone could make external soft-start modules. They'd have
to be sized for the radio, 50 watts, 100 watts, 150, etc.

I believe that Halicrafters built such things into some of the higher
end radios. These were resistive heating coils and bi-metal shorting
strips.

Yes. I have 5 working SB-303's. They were broken when I bought them
and I've been repairing and restoring them.

3563. FS: Collins S-line w/amplifier, Round Emblem

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-08 15:56:52 UTC
From: m38 <m38@cox-internet.net>
Message-ID: <usp1hpg9nkg2a6@corp.supernews.com>
Source record: 37003

FS: Complete Collins S-Line, all Round Emblem. Collins 75S-3C (with CW mech. fileter), 312B-4 wattmeter phone-patch console, 32S-3 transmitter, 516F-2 (in cabinet) and 30L-1 linear amplifier. The transmitter, receiver, and power supply have all been sent to Bud Whitney (Collins specialist) last year to be brought back to factory specs. The power supply was rebuilt completely to solid state and Bud's new specs (AC isolation relay, new filters, new choke, etc.). This S-line is currently on line and can be heard on Wednesday nights on the Boatanchor Net on 3870 khz. I have owned it for 20 plus years and is very nice (excellent) in physical appearance (knobs and dials all look nice). It also includes original manuals. $4200 takes all. Call for details at (979) 693-1461 eves and weekends. Thanks, Mike.

3564. FS: DC supply to Collins KWM-1 tranceiver.

Philco Predicta TVs had a thermistor in the filament string to extend tube life. (Thermistor = high resistance when cold, low when hot.) Makes the set slow to warm up, which I found annoying until I learned what's going on.

Phil

For most boatanchors in the HF region, it will make no difference
what the resistor is made of so long as its wattage, resistance, and
breakdown voltage ratings are the same; or greater regarding wattage
and breakdown voltage rating..

>a Variac, bring the voltage up slowly over 10-15 seconds.

Where would one purchase one of these. Could it be bought at a local store?
What am I looking at in costs? That sounds like a pretty smart investment if
you ask me, thanks for sharing.

>I suppose someone could make external soft-start modules.

You're saying they can't be bought? :-(

Hi,

Have For Sale.....

2 Crystal Holder/Ovens out of older Motorola equipment - labeled at 12 VDC. Not tested.

4 "Cathodeon" Crystal ovens for sale. Seem to be ok when hooked up to 12 VDC. Marked as being useable at 6/12 Volts AC/DC.

Have pics if interested. Also have some older style 8 pin sockets used on many tube sets. Some may have wire on them, all you need do is rewire to your needs. MANY other items available. E-Mail with needs.

>>Even better would be an external "soft-start" device. The ultimate is a Variac, bring the voltage up slowly over 10-15 seconds.<<

That's how I use all my tube radios. Saves the on/off switch and keeps the voltage down to 115v instead of the 125v my service provides. Variacs are for sale all over the place. Small ones that will handle receivers are rather inexpensive. For $119, I got a brand new one that puts out 20amps.

73,
Steve W2ZR

I can matter. Do not use wire-wound resistors where the original is carbon composition and it is in an HF application. The extra inductance is not a good thing. Also, some of the modern resistors may have some minor inductance at higher frequencies. For most boatanchor applications. this is probably negligible, but I tend to stick with carbon comps.

I can't think of many applications in a HF boatanchor where it will matter.
About the only caveat would be a parasitic resistor placed in a control
grid to stop VHF oscillations. For most other applications, the added
inductance will only improve decoupling isolation.

I've got an HRO-60 that needs some TLC, but I have all but one coil set
(missing low BC Band). The 60 was the dula conversion upgrade of the 50. I've
heard rumors that National didn't get this set quite right, and that it can't
compete with the 50. Is that so, or did someone jsut have a dud set? Tnx es

Ron

It is not the URL that shows that matters as that is just the text you
see to click on, but the actual (hidden) URL should be visible if you
view the actual message html text (most mailers have this facility).
The hidden URL will be the scammers, though it should appear on your
browser if you click on it to go there - it will look a bit like the
ebay one but not so close that it can't be registered!

Message-ID: <Pv8z9.2041$FJ2.263802@newsfep2-win.server.ntli.net>
Source record: 37018

I've just discovered that the US Navy had a version of the HRO designated the RCS which is different from the RAS version which had 175KHz IF and no S meter/Crystal filter. I think I have one of these and would appreciate help from anyone that can definitively give me the tube line-up of the RCS or better still a complete circuit diagram, my version has a 6F8 detector/AVC rather than the 6B7 of the HRO and component designations printed on the chassis which bear more relationship to the RAS than an HRO, it also has tapped holes in the top right hand corner of the front panel corresponding to a large ident or frequency chart plate. I can't find any references to the RCS on the Intenet and only came across a mention in Raymond Moore's book on Comms receivers.
Thanks
John

RATELCO Battery charger / Rectifier. Type FC481505A
Model # 102B-3608-00. 48 Volt @ 150 Amps, Float or Equalize.
These units were manufactured SEPT 1991 and are in the Factory
crates and have Never been used, have 2, sequential Serial numbers.
These units can be used as 48 volt charger for Telephone Central
Office Battery supply's with the ability to Float or Equalize.
They can also be used as a stand alone, well filtered, power
supply rated at 48 volts at 150 amps CONTINOUS DUTY.
Input = 110, 208, 240 Volts. 60 Hz, single phase
A must for the expirimenter working with the new generation
of 48 volt solid state RF devices Rated in excess of a Kilowatt.

Weight is approximately 550 pounds, Crated for freight shipping.

1500.xx Prepaid, in my garage in Merritt Island, Florida.

Loading and shiping are buyers responsibility.

>Electronics?

I use the split primary toroids from Digi-Key. While the transformers are
designed to have the primaries in parallel for 120V, they work fine for
low power applications. And they are cheaper.

3602. Resistance chart S-76?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-09 16:08:37 UTC
From: Carl Solomon <cdsol@swbell.net>
Message-ID: <3DCD4F2D.CCD3E30B@swbell.net>
Source record: 37025

Anybody have a handle on a tube socket resistance chart that I could pay to have copied for an old Hallicrafters S-76 receiver?

I've checked the Hallicrafters service instructions book, and also Sam's photofacts. There's a tube socket voltage chart, but I'd like a resistance chart, so I don't have to turn the thing on and breathe all that burning PCB!

Thanks/'73...Carl (W5SU)

3603. WTB: open wire spreaders

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-09 16:16:53 UTC

From experience running a KWM-1 mobile in the 1960s, the connector was
part of the mobile mount. It was great and I could remove the KWM-1
from my 1957 Chevy and connect it up in the house in 2 minutes flat. I
had added 40 meters to the M-1 and it was my only rig at the time.

That connector is worth its weight in gold as the expression goes. They
are very very difficult to find these days at any price.

Hi Evan
If you cut 2" and 4" lengths of old coax and just use the centre conductor insulation by stripping the braid and pulling out the centre conductor you can make any number of them very cheaply. If they are laid on the wire and the wire is heated, it will melt into your new insulators and set permanently.

It's an old trick but works well

It may be an old trick to you but it's the best thing since sliced bread so
far as I'm concerned. I've got yards of 75-ohm stuff with water in it.
Can't wait to start cutting up and pulling out. Rainwater should run off as
from a duck's back. Been rather jaded just lately. Wondering what to do
next. You've just given me something to live for ! <grin>

Put a big signal on 2M, 220 Mhz or 432 Mhz..

AM-6155/GRT-22 Linear power amp, 225-400MHz, 50W out (AM rating -- conservative) 10W in, Eimac X651Z/8930 final, extensive metering, rack mount 7" high, 80 lbs, ITT (model 3212), Part of AN/GRT-22. FAA Surplus. 110 VAC supply.

This Amp uses Emiac X651Z/8930 in silver-plated cavity-drawer; 175-turn TUNE counter dial. Main chassis has solid-state power supply and buffer amp/mulitplier; panel meter monitors voltages. Requires 105/120/210/240 VAC 50-400 Hz and +20 V req 60 ma. +20 V keyed; 7x19x18.5, 80 lbs shipping weight.

The HV Supply from AM-6155 is Loaded with GREAT parts to include a 1752V at 270ma transformer, 8HY 300ma choke, 100K ohm 95 watt resistor, 2x5mfd 3KVDC capacitor, & rectifier circuits card.

One ham has used a 4CX400A (available from Svetlana)to raise the output power to 450 Watts. Others have reported that you can run the 8930 (electrically identical to 4CX250R/7850W) at about 400 watts on 432 Mhz...

A quick Google search on "AM-6155" produced many hits of conversion information.. Check it out.

Used - Excellant Condition (NOT TESTED -- because it is not converted, yet!) $295.00 plus shipping from zip 31088.

Email if you have any questions.

73,

Larry Keith, KQ4BY

3621. Re: HRO 50 and 60 (was Old Hammerlund recommendations?)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-10 00:29:24 UTC
From: Mike Sanders <k0az@sofnet.com>
Message-ID: <usra368pj6ld00@corp.supernews.com>
Source record: 36944

Hi Mike, The HRO50 replaced the HRO7 back in 1950. Then in 1951 they came
out with the HRO50-1 (TorR). The 50-1 included
another IF stage over the 50 model. Not sure of any other changes. The 60
came out in 1962 and ran for 10 or 12 years I think. They
are all good receivers but the 50-1 is a noticeable improvement over the 50
for selectivity. The 60 may have been a bit tight for AM but
I am not sure. However having owned several 50s, 50-1s and 60s I still like
the 50-1 best. I guess that is why after all these years I have
2 of them. The HRO60 was a good receiver and I am not sure what the problems
may have been if any. Talking to several OTs I know
the concensus has been HRO50-1 for National AM receivers. These fellas all
have owned all the versions too and have come to same
conclusion. Bottom line is I would give the 60 a good check out after repair
and see what you think. They are good receivers. GL es 73 K0AZ

Source record: 36950

My clean, neat Halli SR-400A Cyclone III and matching PS-500A.
Mid-60s 5-band 80-10M SSB/CW 400 Watt DC input transceiver
with CW filter, Notch filter, Noise blanker, sidetone, HA-60 PA fan.
All 9.5+ in and out.
No rust, no rot, no smoke, very few Halli paint chips.
Serial numbers intact. Up to specs. Full power out.
Excellent on-air reports SSB and CW.
Manual and some spare tubes.
$500 pickup, $45 double-boxed shipping from 87123 to lower 48.

Not working......$150

Working.........$300

Unless it is a later serial number, 175XX or higher, it will probably have to be re-capped, which is not for the faint of heart. A totally restored SP-600, recapped and aligned properly is probably the premier SWL band cruiser of all time IMHO.

3641. FA: WirelessSet #19 MKII, EXC/MINT, complete less only the key

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-10 18:55:38 UTC
From: Mark@His.Desk
Message-ID: <92atsu8dc213dv5pcifphob4qtr8ml8pn5@4ax.com>
Source record: 36964

Fellow B.A. Enthusiasts,

I've just put up a complete (less only the key) WS#19 set on
EBay. The direct url is

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=734264334

The description as it appears on EBay (less the pictures) appears
below. This set was bought surplus by the original owner in 1946
and partially unpacked. Then it sat for nearly six decades in a
favorable environment (indoors, Colorado). Nearly everything is in
mint condition.

The auction ends at about 10AM PST Sun 17 Nov.

--Mark

==========

Here is a Wireless #19 Mark II radio set, missing only
the key. Included are the transceiver, dynamotor supply,
variometer, mounting base, three control boxes, HF and
UHF antenna bases and whip sections, five headset/mike
sets, canvas cover and satchel signals bag, all
interconnect cabling, and miscellaneous hardware.

Major items have matching serial numbers (1205). This
is the Sherman Tank installation, and was the last U.S.
contract built, but never delivered. A complete inventory
of all items appears below.

I have NOT operated the set, nor do intend to. The reason
is that I know fans of the older gear can be very particular
about the methods used to first fire it up after almost 60
years of inactivity! I'm representing it as complete
(except for the key), apparently unused. Most items have
the original I.D. tags attached.

Shipping is EXTRA, over and above the winning bid. I will
be carefully packing it and shipping by UPS (or whatever
carrier works best) in several packages. Figure on about 150
pounds total NET from Colorado Springs, CO. Insurance, if
desired, is the responsibility of the buyer. Payment terms
are cashier's/bank check or money order.

I'll be available via email for the duration of the auction to
field any questions you may have, supply additional pix,
clarification, etc.

Thanks!

COMPLETE INVENTORY of WS#19 Mark II, Serial #1205:

Condition of all items is excellent+ to mint EXCEPT where
noted. Items not in excellent+ to mint condition are
preceded by a "***", with further explanation.

Wireless Set #19 MKII #1205, ZA 10178, CZR 12440-PHILA-44, PC 92049C

I'd say 20-25 dollars for a complete 1929 set in a binder. That may be
a little on the high side, though.

About $20 if you try to sell them here.
About $35-$40 if you sell them on Ebay.

3652. HRO-60 vs. NC-183D?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-11 13:12:25 UTC
From: Jerry McCarty <microtv@umich.edu>
Message-ID: <b1Oz9.697$ho1.42526@news.itd.umich.edu>
Source record: 36975

A friend graciously donated (dumped) a large box of old magazines on my doorstep. While thumbing through them, I noticed that the HRO-60 sold new for around $150 more than an NC-183D. I've never used either, but I know that the NC-183D is supposed to be an excellent receiver. With the recent Hammarlund thread discussing the merits of the HRO-50 vs. the HRO-60, I'm wondering if anyone has any opinions about the HRO-60 compared to the NC-183D. Was the HRO-60 really worth $150 (in 1955 dollars) more? Thanks.

3653. Wanted: one Drake 4-Line knob

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-11 14:13:52 UTC
From: k5dh@raytheon.com
Message-ID: <AWOz9.23$Z74.350@dfw-service2.ext.raytheon.com>

Variacs and Powerstats are the same thing made by different firms.
General Radio made the Variac and some perfer that brand. The generic
term is "autotransformer".

These are expensive, $50 to $100 but are very useful. For an unknown
condition radio, you want to fire it up slowly, gradually increase the
voltage.

Big transmitters sometimes have variacs built into them. Part of the
startup procedure is to crank up the voltage by hand.

There are various kinds of softstart devices for specific applications.

Harbach Electronics makes units that you solder into an SB-200 or
SB-220 linear amplifier. This is a small circuit board with big
resistors, relays, and a timing circuit. Initially, the current flows
through the resistor, this prevents the inrush shock to the tubes.

After a brief delay, the relay closes and applies full voltage. Given
that an amplifier tube set is $100 and up, Hams install softstarts in
their amps. I have one in my SB-200.

I would not want to modify a valuable antique radio by adding such a
device. For the SB-200, it's almost a standard feature but I would not
install one in an S-38. For those, I would make a two switch start-up
box.

Flip the first switch and power is applied to the radio through a 40
watt power resistor. If the radio draws 100 watts,

100/120 VAC = about 1 amp. so that's about 100 ohms.

A good value for the resistor might be 100 ohms. That'll reduce
the insurge.

A second switch shorts out the power resistor and applies full voltage
to the radio.

>
> >I suppose someone could make external soft-start modules.

> You're saying they can't be bought? :-(
>

I guess the market is too small for a specialized product like this.
You can easily make one though.

3655. Trade/FS: Collins radio

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-11 14:55:33 UTC
From: gspubl@tca.net
Message-ID: <3dcfc4b9.1478187691@news.tamu.edu>
Source record: 36978

FS/Trade: All round emblem Collins 75S-3C (with CW mech. filter), 312B-4 wattmeter phone-patch console, 32S-3 transmitter, 516F-2 (in cabinet) and 30L-1 linear amplifier. Transmitter, receiver, and power supply have all been sent to Bud Whitney (Collins specialist) last year to be brought back to factory specs. 516F-2 was rebuilt to new specs(AC isolation relay, SS, new filters, new choke, etc.). Hear it Wednesday nights on the Boatanchor Net on 3870 khz. Owned 20+ years and is very nice (excellent) in physical appearance(knobs and dials all look nice). It also includes original manuals. Trade or $4200. Call for details at (979) 693-1461 eves and weekends. Thanks, Mike.

3656. FS Collins 516F-2, & 312B-4

3657. HEATHKIT APACHE TX-1 PARTS AVAILABLE

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-11 16:20:32 UTC
From: Al Link <K4ICL@Charter.net>
Message-ID: <usvmeasdsdf3ca@corp.supernews.com>
Source record: 36982
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

Apache Owners and rebuilders:

The following Original Heathkit TX-1 Apache parts are currently available:

Audio preamp transformers, $5.00
Chassis control hardware, $8.00
Drum and related assembly, $8.00
Driver band switch, $5.00
Final band switch, $9.00
Final loading condenser, $8.00
Final tuning condenser, $9.00
Front panel complete (glass cracked but easily replaced), $17.00
HV plate transformer, $29.00
HV power supply choke, $ 27.00
Meter switch, $5.00
Meter, $ 8.00
Meter mount with pilot light sockets, $2.00
One pair of good 6146A tubes (tested good), $18.00
Set of the "satinized" knobs (not the chrome plated ones) (1 medium sized is damaged, all others good), $16.00
VFO assembly (less tubes), $8.00
Undamaged cabinet (needs refinishing), $21.00 [Fits Mohawk and other receivers.]
Various pots, switches and other controls, $2.00 ea
6146 tube sockets, $2.00 ea
Final plate choke, $6.00
Driver plate choke, $4.00

Inquire about any minor parts you do not see above.

Email your needs and zip code. Specify Heathkit part number, if you have it.

Above prices do not include shipping. NO out of country shipping is available.

Cheers,

AL

3661. Another Rip Off

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-11 17:48:37 UTC
From: G4VGO <rmread@attglobal.net>
Message-ID: <3dcff0c1_3@news2.prserv.net>
Source record: 36984

OK, enough is enough!!!! I see on a major UK equipment emporium's website that they will soon begin to charge for listings on their "Used Equipment" site..it supposedly has to do with a vetting of CBA's, etc. All this is meant to protect us from the unscrupulous private traders (probably M3's who have shifted from flogging CB radios to amateur radio kit). Maybe too much competition for the said emporium, but that is not for me so say.

Now, we all know that G3CWI (http://www.qsl.net/g3cwi/the.html) has a much better site for such trading in private used kit, and it is FREE. Why is the emporium about to charge? I may be able to give some insight into this. They want to make a few more quid from us poor amateurs after a failure of the naive M3 herd to materialise..the M3's (being mostly CB'ers and a bit too wise) aren't buying enough kit at rip off prices!!!!!

My job takes me all over the world and I work in telecommunications. I have spent a lot of time in Japan, and have obtained the F.O.B. (shipped price) figures from all major amateur radio manufacturers who sell to the USA, EEU, etc. By the way, the EEU is the "cash cow" for Japan..what a surprise!!!!!! Like the motor manufacturers, the Jap electronics boys are sticking us BIG TIME!!!!!

For the price of a few bottles of a very good whiskey (good kit from my wife 's land of the Jock's) it was universally possible to get the inside information that we all need to know. What do the big boys pay to get the kit shipped from Nippon to the UK? Not that the prices are what the USA boys pay, the EEU dealers get hit with about 25% to 30% more than the radio cartels in the States get their equipment for. But, we pay more than 110% more than the Americans pay.where is the difference? VAT, maybe. Cartel dealerships, maybe. Extended warrantee, maybe. Service, maybe. Mostly a rip off, but that can't be proved.

Bottom line, unless the said emporium says it will reverse its charge for small ads, I will publish the prices, FOB Japan, for all major amateur manufacturers.. and as a bit of enlightenment, the USA FOB prices from Japan as well. Could cause a bit of a rebellion.

'Nuff said.

Bob G4VGO

3667. Re: HRO-60 vs. NC-183D?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-11 21:34:51 UTC
From: Pete KE9OA <n.gianakopoulos@worldnet.att.net>
Message-ID: <%nVz9.780$vM1.49493@bgtnsc04-news.ops.worldnet.att.net>
Source record: 36990

The HRO60 was a better receiver. Image rejection across the tuning range was 80dB+. The fact that the unit had the plug in drawers allowed the designers to optimize the tuning circuits. The HRO50 was similar, except that it was a single-conversion design, vs. the HRO60, which was a dual-conversion design.
Now, if I was going for a National boatanchor, it would be the NC400. Too bad that there aren't too many around.

Pete

3668. FS: Still have Mosley PRO57A 5 band antenna

Hi- I still have the Mosley Pro 57A antenna for sale. 24 ft boom, all stainless, 5 bands ie 10,12,15,17,20 and with a Mosley kit -40 or 30 can be added giving 2 elements on either those bands at 4db gain. The antenna is 7 elements and 8+ db forward and 20+ db f to b. These are made to last for years and will take 5kw pep. It belongs to older ham having to move to retirement quarters. He only ran 100 watts into it. Hes the original owner from new. I took it down and its in beautiful shape. $450 and Ill ship stateside to your door. I'll be back on the 19th. First confirmed offer will get it. Thanks all for the read and 73s Lew KlNDV

Google for "tubester". In the late 1960's and 1970's, there was an effort to replace vacuum tubes with solid state devices. The simplest were silicon diodes in tube bases to replace 5R4's and such.

There were also solid state replacements for triodes and pentodes and such. These were FETs with support circuitry sitting in miniature tube bases. These were available for the more common tubes.

I *think* but am not certain, that there solid state replacements for every tube in a 75S-3.

Hi John!

Don't know if this helps any, but they sure look like the old AAA radios I used to use when working for an AAA affiliated service station in the St. Petersburg, FL area back in the late 60's.

I believe it was 150 MHz, but not sure after 30 some years.

Hope this helps.

Will Rogers

Hello All,

I have for sale two units made by B&W.

I have a B&W Matchmaster in real nice condx. I've never used it though, so I can't tell you if it works. Looking to get about $65 plus actual shipping.

I also have a B&W334A Dummyload/Wattmeter. This unit in not working. It's in nice physical condx, but the inside unit that contains the load resistor has been opened & the oil that was in it has been drained out. Everything else is there. I suppose it's possible to repair it. I have the original manual to it. Best offer plus actual shipping.

Pictures of both can be seen at:
http://www.qsl.net/k2fw/sale_items_4.htm

Tks very much,
Steve K2FW

Boy, its been a long time. In about 1970 a friend had one converted to 2 meters. I later had one as a base station at my home as part of my work.
In both cases they were VHF-FM, 120 volt units with 15 or 20 watts out but I recall there were other versions with the same 'look'.
I think the model number was Model 600. They used to be common as dirt so there should be plenty of service info available.
I recall them as being very solid, dependable rigs. Try searching on Google for Aerotron 600 and see what pops up.
If nobody bids against you, you've got a heck of a deal.

Source record: 36851

Those are VHF FM radios. They run about 20 watts out, more or less 140-170 Mhz (Aerotron did also make a low-band version for 30-50 MHz.). As I recall, they operate on either 12DC or 110 volts AC. They use octal-type ovens for the crystals. We used them in CAP and MARS 10-15 years ago. Ours were single channel, although some came out as 2 channel. They're getting rather old now, although those two on Epay looked in pretty good shape.

Apache Owners and rebuilders:

The following Original Heathkit TX-1 Apache parts are currently available:

Audio preamp transformers, $5.00
Chassis control hardware, $8.00
Drum and related assembly, $8.00
Driver band switch, $5.00
Final band switch, $9.00
Final loading condenser, $8.00
Final tuning condenser, $9.00
Front panel complete (glass cracked but easily replaced), $17.00
HV plate transformer, $29.00
HV power supply choke, $ 27.00
Meter switch, $5.00
Meter, $ 8.00
Meter mount with pilot light sockets, $2.00
One pair of good 6146A tubes (tested good), $18.00
VFO assembly (less tubes), $8.00
Undamaged cabinet (needs refinishing), $21.00 [Fits Mohawk and other receivers.]
Various pots, switches and other controls, $2.00 ea
6146 tube sockets, $2.00 ea
Final plate choke, $6.00
Driver plate choke, $4.00

Inquire about any minor parts you do not see above.

Email your needs and zip code. Specify Heathkit part number, if you have it.

Above prices do not include shipping. NO out of country shipping is available.

Cheers,

AL

They were good receivers. The 183D was the first receiver that I owned, that didn't give you that "second chance" to tune in the images of strong stations. I did like that 6 Meter coverage, and I even found the NBFM adaptor. This was back in the 70s, so everything is long gone.

Pete

Folks
Here's an obscure question.

I have a set of cards (that look as though they were profesionally produced) giving dial readings vs. frequency for HRO coil packs from 1.7MHz and up.

Now, I would like to reproduce these cards for the other coil packs in the series. Does anyone know what the mathematical relationship is between dial reading & frequency?

Hopefully, I'll post up the cards (or an Excel SS) when done.

Thanks

Adrian

3693. Design of VR150s

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-12 08:07:36 UTC
From: Paul Cooper <plcooper@starband.net>
Message-ID: <3DD0B6DC.90300@starband.net>
Source record: 36866

To all of you who have worked with the old VR-150s:

I need to design a 900 volt string of VR-150s for screens and the need is to take two separate strings off a dropping resistance from the B+ supply, the taking of which is standard procedure.

If I remember correctly, if one uses a single string it is not necessary to use equalizing resistors between the 6 VR-150s which would make up only one string. But, since there are 2 strings, I would be actually running both in parallel and would require equalizing resistors between them. I also remember that some designs used but one resistor for each string either at the top or the bottom where the string went to ground. Assuming that one must use equalizing resistors between each of the VR-150s in each string what value should be used? It would seem that a value of 50 to 100 ohms each would suffice.

If anyone has any input on this, please advise.

Paul, K6PY

Hello all!
I have a nice Heathkit TX-1 for sale. It is not restored. Original cabinet in good condition. Looks like all original tubes. Has good outout into dummy load. Cabinet inside is copper plated (I had not seen this on other Apache's) Asking 150.00 plus actual shipping via UPS or Fedex (Can do Airbourne Express also) Pictures available if requested (I have to move it into good lighting to take pics and its heavy)

There isn't any. Each dial was individually calibrated for that
particular receiver due to variations in manufacture of the
components, like the main tuning cap, and variations in the hand
wiring of each unit. That's a real calibration chart for that
receiver and is quite accurate....or was.
>
>Hopefully, I'll post up the cards (or an Excel SS) when done.

I don't mean to make anyone sick, but when I left the Charleston Naval
Shipyard's Metrology Laboratory in 1988, there was a totally cherry,
totally complete National HRO receiver sitting in its custom-made
National matching 18" rack, complete with all coils, cal charts for
each coil, a full set of impeccably perfect manuals and all sitting
proudly in the time and frequency section of the lab where it had
spent its entire life in the rigidly-controlled laboratory environment
happily providing WWV signals on 5, 10 and 15 Mhz from a long wire
antenna lovingly put through a complex lightning arrestor tied to the
huge main grounding system of the lab. The cabinet had not been moved
since I entered the lab first as a young sailor in 1966 and the day I
left in 1988 to run my own electronics business when I realized the
most productive shipyard on the East Coast would close to politics
forever.

While walking around the old carcass of the yard reminiscing,
recently, I happened on a man walking out of Building 177, the old
Electronics/Electrical shop, and asked him if I could go up to the
third floor where the lab was located to look around. "Sure, but
you'll have to climb the stairs. The elevator hasn't worked in a long
time.", he said, flatly. My beloved cal lab was an empty room,
stripped entirely of all that beautiful, immaculately-kept, equipment
we worked so hard for. It was just gone.

Gone, also, was the immaculately-kept National HRO receiver and all its parts. The only thing left was the coax connector in the wall looking forlornly for its mating cable to its beloved HRO.

I really don't want to know what happened to it. I had visions of some Navy bureaucrat unceremoniously driving over it with his bulldozer pushing it into the electronic scrap pile in some awful scrap yard in a light rainstorm, gouging and scraping all the perfect paint off the front of it, smashing the coils to bits and destroying the perfectly-preserved calibration charts in the mud.

It was so sad. I cried for it all on the way back down those stairs. They were SO much longer going down than coming up......all that work, for nothing......

Damned Democrats!

Larry

Larry
Any chance that you may recall any differences between a Navy HRO which I think was known as an RCS (not RAS) and a "normal" HRO. I have a question about it further down the newsgroup - I have a set which may an RCS which has a 6F8 rather than a 6B7 as the detector/avc tube. I'm looking for a circuit for it or any other info.
Some sets still live on....
Thanks
John

Apache Owners and rebuilders:

The following Original Heathkit TX-1 Apache parts are currently available:

Audio preamp transformers, $5.00
Chassis control hardware, $8.00
Drum and related assembly, $8.00
Driver band switch, $5.00
Final band switch, $9.00
Final loading condenser, $8.00
Final tuning condenser, $9.00
Front panel complete (glass cracked but easily replaced), $17.00
HV plate transformer, $29.00
HV power supply choke, $ 27.00
Meter switch, $5.00
Meter, $ 8.00
Meter mount with pilot light sockets, $2.00
One pair of good 6146A tubes (tested good), $18.00
VFO assembly (less tubes), $8.00
Undamaged cabinet (needs refinishing), $21.00 [Fits Mohawk and other receivers.]
Various pots, switches and other controls, $2.00 ea
6146 tube sockets, $2.00 ea
Final plate choke, $6.00
Driver plate choke, $4.00

Inquire about any minor parts you do not see above.

Email your needs and zip code. Specify Heathkit part number, if you have it.

Above prices do not include shipping. NO out of country shipping is available.

Cheers,

AL
K4ICL

This wasn't a Navy receiver. It was a real National HRO. I never had
it apart. I don't think anyone ever did. It worked just fine so I
can't answer your question. My ship had RBAs and RBBs on it to go
with the TBKs, TBLs and TBM transmitters. We also had 6 TCSes,
too...(c;

Nice looking Apache. Appears two have original tubes. Good output into dummy load. No Mic. Copper plated cabinet interior. Asking 150.00 plus actual shipping costs from zip 33813. I will post pictures on my web site
http://home1.gte.net/res096zp/pics.htm

Should be close to 100 pounds packed for shipping !

If each string is handling 40mA max, the proposed 100 Ohm resistor at
the top of each string would normally drop only 4 Volts. With six
VR-150's, each of which can droop up to 5.5V between 5mA and 40 mA load,
that's 33v dynamic regulation.
A 1 K Ohm 5 Watt resistor at the top of each string sounds like a safer
bet. At the junction of the two 1 K resistors, tie the large dropping
resistor to the unregulated HV source.

3705. Hammarlund HQ-200 Help Update

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-12 22:49:17 UTC
From: Chris Dorn <cdorn@telusplanet.net>
Message-ID: <NzfA9.39747$U93.3102480@news2.telusplanet.net>
Source record: 36878

Hello again,

I posted about a week ago regarding hum in a Hammarlund HQ-200. Some of you replied with some helpful tips, and I thank you. To date, I have replaced (yes, removed from the circuit), the old electrolytics in the power supply. This did very little if anything to reduce hum. Pulling tubes helped to locate some hum around the 12AX7 preamp. I replaced the 12AX7, and this did help to reduce some growl and buzz. Seems I had a noisy 12AX7. I found some other weak tubes, and replaced them as well. I still have some low level hum remaining. When I listen closely, I can hear some faint cracking and sizzling noise. Now, how much of this can be considered "normal?" Some people say zero hum is normal, where others say some hum is normal in tube sets. One other member suggest some grounding problem as a result of corrosion. Perhaps. Just how much hum is "ok."

Thanks,

Chris VE6RDC

Collins MM-1 microphone.

"Designed to fit your hand comfortably. Engineered for max voice
response, die- cast case finished in brushed satin chrome. A five-foot
length of Koiled Kord with mike plug is supplied."

The MM-1 has a frequency response from 200-10,000 cycles per second
and
has an output level of -48 db.
Excellent condition with the original Collins style plug.

Reduced to $150.00 plus shipping

If you turn the AF or volume control all the way down do you hear any hum in the speaker? If you do you have power supply hum or HK leak in audio stages after the volume control. If you have a scope you should be able to tell if it's 60 or 120 cps. If it's 60 it's HK leak or short and if it's 120 cps it's the power supply filters. New tubes and filter caps can be defective and drive you nuts looking for something else.
good luck

How much hum are you willing to put up with?

The crackling and sizzling is probably due to noisy resistors, and
that is less bothersome to me than hum.

I find hum very annoying, while others don't seem to mind it as much.
It is possible to eliminate the hum completely if you are willing to
spend the time, but whether it's worth the time depends on you.

Snip

If you had an original coil chart for a coil set for that receiver, you
might be able to extrapolate the other ranges with some work based
on spot measurements across each range.

Pete

3711. FS: Hallicrafters SR-160 Transceiver

Newsgroup: rec.radio.amateur.boatanchors

Source record: 36884

The SR-160 is a compact tri-band SSB/CW transceiver. It is in working condition and looks nice.

The outside view. The "sunburst" around the main tuning knob is reflections of the flash in the knob flutes, not imperfections in the panel. The case has been repainted and looks nice.
http://home.earthlink.net/~ab7yd/misc/SR160Outside.jpg

The inside view. Very nice internal cosmetics.
http://home.earthlink.net/~ab7yd/misc/SR160Inside.jpg

No power supply with this unit, but I will include an adapter if you need it that allows the SR-160 to be powered the Heath HP-23 supply.

Price $110 plus shipping from Seattle.

73, Bruce AB7YD

> He wants the meter for *far* less than a new, comparible-size meter!

Well, perhaps, but I am quite willing to pay $25 including slow boat shipping and insurance to Virginia to anyone willing to dig through their junk box and pull out a working Weston Model 801-58 100uA meter movement in just about any physical condition, cracked case, cracked glass, missing hardware is ok as long as the meter works and the pointer is not bent or broken. The Weston Model 801-58 is a retangular panel meter approx 4-1/4 x 4 inches.

While you're in there, I'm also looking for a 3-3/8 inch round sealed Phasetron 200 uA ruggedized military type meter movement, same deal.

If possible, please send face scans for positive Id.

Please e-mail
Thanks for reading,
Mike WB4UKB

Hi
I am refurbishing some old equipment and have the need to find some dial
cord.
Any one know where this can be found?
Many thanks
Martyn

Fishing tackle shop. Check out the fishing line. It's the same as what used to be sold for dial cord and there's a large selection of sizes and quality. You can even find wire center line at a better shop.

Hey Folks... Say, any hams on the newsgroup that also sail??
I am not into it, but a friend querried me on the subject of receiving
weather Fax while
sailing. I told him I no little about it, but would look into it.
How is it done, and what kind of equipment is required?
I told him it was either wide-band FM aroun 136 Mhz direct off a satellite,
or
land based wefax info off the hf bands.
Can anyone set me straight on the subject?
I sure could use some enlightenment.
Regards....Dave KD2E

I have a great HQ-129X I restored. I replaced all the paper tigers with orange drops and had Frontier Capacitor rebuilt the filter cap. And it still has detectable low freq hum in the speaker even with the volume all the way down. With volume up to reasonable listening levels the hum is covered and not noticable (except on talk radio <grin>) and the audio is great.... full and clear. I have no static pops, growls or other noise.... just a bit of 60 Hz buzz.

I'm beginning to think that to some degree the level of hum one notices depends on your ability to hear it. Only about 2 in 5 people when asked can hear it at all. The others swear it's hum free. In general it sure isn't bothersome but it is frustrating trying to live up to the hum free rig many people remember.... was it really ? Who knows.... maybe their ears weren't as good as mine ...

Mike, W9WIS

So . . . Dacron fishing line is the same stuff? Now I know.

One day, seems not long ago, I needed some dial string. I bought some at a local parts store, used a piece of it and put away the rest. One day recently I needed more, searched the house and couldn't find it, then checked with the parts stores only to find that this stuff hasn't been available for several years! I ordered some at AES, got it, then -- as you might expect, found the other stuff the next day. Geez . . . seems not long ago you could buy those 45 RPM spiders at any record store, and I recall not long ago you could buy steel needles at Woolworth's, 25 for 25 cents. If I can find a Woolworth's I'll check to see if they've still got 'em.

My how time flies.

I think Newark or Allied still carry the stuff... our cable assembly guys
use it and it's still required for a lot of avionics stuff, although I
am sure they'd much rather be using nylon ties.

What would a radio hobbyist ever do with 500 yards of lacing twine?
Cost doesn't sound prohibative for the amount, but that would be
several lifetimes of supply. I used waxed dental floss on an old
radio once. It would have been better if it were black, but it seved
the purpose.

3742. Help wi Tube Freq Standard

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-14 03:20:42 UTC
From: Michael Melland <w9wis@charter.net>
Message-ID: <ut65h3ibb9fn06@corp.supernews.com>
Source record: 36915

I have a very nice AN/URQ-9 freq standard.... yes it's old but it work(ed) great. It has been happily oscillating along for the past several days when suddenly it stopped working. It has a ovenized crystal oscillator and also 4 ea 5840 peanut tubes in the Oscillator Amplifier section. The oscillator puts out 5 MHz and then the rig utilizes dividers for 1 MHz and 100 kHz. There is very low output comming from the oscillator amp section.... and it reads about 3.0031.... MHz on the counter. My suspicion is that one of those 5840 tubes went south. Nothing burned and everything else works fine. but no real output and what there is is that odd freq.

Any ideas ? I'm not exactly clear what the function of these 4 small tubes is.... but they are my best suspects.

Mike

I guess I 'm the only person who uses them, but try C&H Sales,

http://aaaim.com/CandH/

Do a search for "lacing", should bring up a few choices; one of
which is 500 yards for about 8 bucks. Also worth looking at some
of the other stuff they carry.

Peter

Robert-

How many (approx) feet do you need for the job?
I have some black here, plus a couple rolls of white.
More black can be had, if I can re-locate it at a radio buddy's place.
E-mail me if you want some.

I have a Hallicrafters SX-101A in good condition. Works on all bands.
USB/LSB/AM/CW.
Lettering sharp. 100% electrical.
Trade for a Johnson Ranger, Viking 1 or 2 working.
Perfer someone in the pacific northwest. Thia receiver is "heavy metal".
Also looking for a field day transmitter 50-75 watt class. Globe Scout ect.
Looks not important. (Taking to field day in mountains.)
Conteact josuha@charter.net
Thanks for reading..

Well, the website lists the address on Colorado Blvd. in Pasadena, so that must be the place. Great to browse in, but not to buy. Just like the Original Whistle Stop train shop a few blocks down.

Still, I didn't know they did mail order, especially for things like dial cord.

Regards,

DAve

3752. FS: Johnson Turbo Ranger +

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-14 14:04:32 UTC
From: Ron Eisenbrey <ab5wg@mylinuxisp.com>
Message-ID: <3dd3ad57$1@news3.mylinuxisp.com>
Source record: 36925

I have for sale a Johnson Ranger Turbo +. The (+) comes from additions to the original Turbo by Gary Blau. It has all the revisions per Gary's original update to the Ranger. These can be viewed at W3AM.com. The modulators are a matched pair of Svetlana SV6550'c. The cabinet has been refinished and new silk screening on the panels. In addition, the rig includes:

Jensen Line Input Transformer
Screen Grid Voltage Regulation to the 6550's
Adjustable Power Output by regulating the 6146 screen voltage-works great with your linear, just like the solid state rigs.
Revised meter shunt circuit to protect SW5
Negative Peak Limiter for the modulators-protects the modulation transformer and prevents over modulation.
Full push-to-talk capabilities.
External Fan mounted on rear along with Dow Key antenna relay.

I have the original manual as well as complete documentation on all modifications organized in a three ring binder. This is a wonderful sounding and beautiful looking AM rig, true broadcast quality. I have had my fun with this rig and now it is time for another to enjoy it. I have a MS PowerPoint presentation available on this rig for serious inquiries. This rig is spotless, inside and out. $650 plus shipping. I also have available a Marshall studio mike and Apex 104/Symetrix 528E voice processing chain for interested parties.

Thanks,

Ron, AB5WG

Message-ID: <dYSA9.2453$3J1.277790@news1.telusplanet.net>
Source record: 36928

Hello again.

I've decided to sell the HQ-200. The electrolytics and tubes have been replaced. The radio plays well and all functions work. There is a very low level hum that I mentioned in my previous posts. This hum is covered with normal listening levels of audio. Some have suggested this may be normal for this set. Cosmetically the radio is around a 9 out of 10, and I tend to be picky. The manual is included. A speaker is required. I am asking $250US for the radio plus shipping charges. My asking price is based on Osterman's book, previous NG prices, and EBAY auctions. I can provide references from previous sales. Please contact me via e-mail if you have any interest. The radio will be off to EBAY if no interest here.

73,

Chris VE6RDC

All:

For those who need it, I will email a zipped copy of the complete manual with schematic. Let me know by email if you want it sent to you. It is a little over 3.4 MEGAbytes. Each page is a high resolution .jpg. The schematic is 6 .jpg's. You will have to unzip the file to get to the .jpg's.

The COMMERCIAL use of these free files is STRICTLY PROHIBITED. The files may be distributed to others only if provided AT NO COST, including distribution media.

Cheers,

AL

I am a Radio Officer in the US Merchant Marine, and on our ship we use
JVCOMM32 and any HF receiver to get excellent weather maps. However,
be forewarned, the number of stations transmitting maps is dwindling.

Try Marius Rensen's site http://www.hffax.com the definitive site on
HF Fax, get free software there too.

In US, we use Boston, New Orleans and in Europe HAMBURG.

Jim

LOW reserve

3777. FS: Hammarlund HQ-120X Receiver

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-15 16:56:30 UTC
From: Bruce Stock <ab7yd@earthlink.net>
Message-ID: <2H9B9.1297$B85.144625@newsread2.prod.itd.earthlink.net>
Source record: 36800

The HQ-120X was the first model of Hammarlund's famous HQ-series of receivers. It is a 12-tube general-coverage short-wave receiver covering .54 to 31 Mhz in 6 bands. This unit is in excellent electrical and physical condition, and it makes an excellent SWL receiver. It is unmodified and has been re-capped. The case has been re-sprayed and looks very good.

Photos of the external and internal cosmetics:

http://home.earthlink.net/~ab7yd/misc/HQ-120xOutside.JPG

http://home.earthlink.net/~ab7yd/misc/HQ120xInside.JPG

And to further whet your appetite, some original advertising:

http://home.earthlink.net/~ab7yd/misc/hq-120x-3.jpg

http://home.earthlink.net/~ab7yd/misc/hq-120x-4.jpg

The radio will weigh approximately 60 lbs when packed for shipping to you.

Price is $130 plus shipping via UPS Ground to your location from Seattle, WA.

73, Bruce AB7YD

WS 19, MK II

very nice condx, front is fine. slight moddification.

power and tel/mic connectors changed, extra control pot lower left but

easily removded. All other controls ok, some knobs different but not
really too great a prob to replace, internally looks complete, with
vhf section, all valves except back two in i/c sction.

not tested, s.a.s.

£60 plus postage.

WS19 control box No 2, as new.. £10

Ben G4BXD.

I have one of these, in pretty good shape, including the base station AC power
supply with built-in speaker. A nice little dual-conversion rx, though I think
it needs some TLC because the sensitivity is not outstanding. I also covers
the BC band, as you know.

>Would anyone have an idea as to what this rig might be worth ?

Ostermann's book says that this rig is so rarely traded that it's hard to
establish a price. I think I paid $100 for mine aobut 6 years ago. --Mike K.

3809. Re: P.S. Transformer

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-16 21:40:47 UTC
From: Tom Coates <tecoates@comcast.net>
Message-ID: <TOWcnSK_zJL9JkugXTWc3w@comcast.com>
Source record: 36832

Why not get two identical 2A 12VCT transformers and connect the 12V windings in parallel?

I wouldn't attempt to get more than about 150-160 VDC (by, say, connecting the 12V out to 6V in) because the 120 V winding may not be insulated for it.

RS and ALL Electronics sell the transformers.

This looks too simple. What's wrong with the idea? (Besides failing your one transformer rule.)

Tom

Actually, I think there was a relationship. Each coil from A-D covered two ham bands. The lower frequency band started at 50 and the higher frequency band started at 450.

Also, I think the RAS had a differnt IF, perhaps 500khz and the coils are not compatible with the civilian models. M models I think used regular 455 khz IF

This is from an estate. It is a nice (old) SpeedX Morse Code key mounted on a piece of wood with a nice oscillotorand a 9V battery holder for Code Practice. It is missing the spring but is otherwise complete and ready to go. The stamp on the bottom of the wood indicates that this belonged to W1QQL of Lynn Massachusetts who was also a Registered Professional Engineer.

$20.00 includes shipping within the USA. If interested please reply by e-mail.

73,

Michael, W1RC

GRUNDIG YACHT BOY 400PE
With Mute and Fine Tune Mod!!!, Manual, Original box, carrying case, Wall Adapter, long-wire external antenna,
Hardly used! -$105.00

BELTEK 23 CHANNEL AM TRANSCEIVER
This one's an oldie, looks like a mid seventies transceiver, couldn't find anything on the web about it. It measures about
12x10x4 in an all metal cabinet, it has a 120v ac as well as connections for 12v mobile. This is a solid state transceiver
and it works. -$15.00

I'm located in SW Ontario, shipping to anywhere in North America is about 8-12 dollars for these items.

Regards.

Not unless it weighs at least 50 pounds for a receiver and 80 for a transmitter. If it's smaller, like a DX-60, but has vacuum tubes, it qualifies as a canoe anchor.

Message-ID: <3dd9f02d.1594571@news1.c2i.net>
Source record: 36769

Hello,

I have one of these very nice vintage power triodes in stock. RS 31g
was made by Telefunken and have some similarities with the RS 237
which is not far from 211.
The heater on RS 31g is 10V 4.8A, anode dissipation is 65W and max
anode voltage is 1600V. The valve is NOS and in its original box. The
price is NOK 910.- or about $ 120.- You can find a picture and more
data, and you can even order it from my web site: www.demostenes.no
Just search for RS 31g.

Regards,

Arnold Goks�yr
DEMOSTENES - N6899 Balestrand, Norway
Tlf. +47 5769 1340 Fax +47 5769 1267
http://www.demostenes.no

Thousands of different valves in stock as well as
sockets,transformers,books,caps,resistors and
other components. Web site is updated every week.
You can order on-line.

I think a very select few count as "honorary" boatanchors.
One is the Drake TR-7. Haven't heard of any of the
Ten-Tecs being so honored.

Doh! EBay!!!

Are you searching and bookmarking under the several possibilities:

1- GRR-5
2- R-174
3- PS-308
4- C ??? - the number for the case.

Sellers often do not know how to read mil-tags!! I almost won an auction for a bare case recently.

AN/GRR-5 - One of the truly great mil radios of all time. Yet very few know about it.

Within the past 6 months I've gotten a mint GRR-5 only 75 miles away, which I picked up in person of course.

Also a PS-308 about 200 miles away which I picked up in person since I got other heavy items from same seller.

PS-308: it is nice to get spares of this so you will have options wrt power supply designs as well as room to install any possible transmitter. The stock PS allows operation on just about every known voltage, but is dependent upon an oversized relay that never seems to work and is a power-waster. Rip the sucker out. Also substitute a solid state multi-vibrator
for that mechanical vibrator if you can be clever enough. Or just redesign the whole PS to suit your needs. Requires 1.5v dc for filaments and 90vdc for B+.

The radio is a dream come true in stock form- needs nothing!!! Hot on 17 meters!
A joy to use on all bands. Has unique dial with robust mechanical detents to set for
favorite channels. A true classic.

The case is also offered for sale. These are very useful and AFAIK rather unique. All components of GRR-5 are 'to be saved'- never walk on by lest the seller end up trashing it.

>

My NC-183D is 'hot', especially on 40 meters. The HRO-60 is much less
so, but is overall much more of a receiving system. Of course both
need to be refurbed as they have been sitting for 10 years+. Along
with the HRO-50, the NC-303, the Aussie 'HRO-5', the NC-125, and the
R-123 (is # correct?) there is a good National quorum here.

First- this is in no way "off topic."
Most boatanchors run AM, and awards for so doing are
fair game for discussion.

Getting the League to create this endorsement might be tough.
There is a big bias against AM at the ARRL.
And with Mr. FCC's negative comments at Dayton about
using "6 KCs of bandwidth", that makes it double tough.
I've been a ham for almost 30 years and I've never seen
the day that a AM QSO or two on an HF band was doing anyone
any real harm. Sometimes an SSB asshole or three
want to start a stink and raise cain, but in almost every case
the movement of a few hundred cycles into
otherwise empty spectrum would have solved
any real or (usually) imagined problem
for the Donald Duckite and his stooges.
Nevertheless, there are people who take things like this
on as a matter of religion, and by God you're going to do
it their way or else. You can usually ignore these freaks,
but not when they're in charge.

3867. REPOST: FT-480R repair help/advice needed

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-20 07:29:34 UTC
From: Richard J <no_spam@please.com>
Message-ID: <arfdl6$8v2$1@news.lth.se>
Source record: 36790

I just had to repost this - not a single reply yet...maybe better luck this time?

Hi group -

just started up an old FT480R 2m allmode, Eu version.

The display shows 445000.0 and nothing happens when dial is turned. There's life in the box -RX has hiss, squelch and all modes seem to work, dunno if TX works, but it goes into TX mode, so I thought it might be nice to save it/fix it. AFter all, it's a multimode.

Have schematics and adjustment handbook. Adjustments all require that you tune to this or that frequency to read voltage in PLL unit testpoints (for example). Problem is, I can't tune - at least it doesn't look like it.

Any ideas on what to do, where to look next? Is this a display driver problem, a PLL/VCO problem or a tuning decoder/whatever problem.

Beats me where to start. Haven't done much repair of stuff in my ham life...but have decent range of instruments, incl scope, counter and VTVM. I bet someone out there had the same problem. I remember the IC211 for having typical faults in PLL unit....is this the same story?

Advice appreciated. TIA for your time, guys.

73 /Rick, SM7SCJ

I agree with Mr. Stinson.

Personally I couldn't care less what the arrl does anymore. Their anti-CW spirit has me tossing the magazines from my lifetime subscription in the waste can every month.

The League speaks out of both sides of its mouth. On one hand they whine about 6 KC AM bandwidth being too much but then they condemn CW with its lesser bandwidth. But then they try to sell more magazines with their sappy covers with pictures of the fine, old vintage gear.

Years ago they offered a 160 meter AM endorsement but I do not know if they still do. I really don't pay any attention to them anymore.

No....I don't think if it involves doing anything with modes and gear that is older than 5-10 years they'll be supportive. I wish you the best of luck and maybe...just maybe...you and Pete can get through to them that they need to stop alienating the folks that built their organization over the years.

Beware that those meters likely need a expensive calibrated shunt
resistor to display the correct current. By themselves they are just mV
meters.

Hi Rick

Time to put the step by step procedures aside and start looking at individual modules. I would start by hooking a dummy load/wattmeter to the rig and see if it transmits and if so , use your counter to determine on what frequency. If it transmits in band, then loosely couple a signal generator to the antenna input and see if it receives on frequency (keeping in mind it may have an offset programmed). If the above all checks out, then trace back from the display unit to see where the glitch is. You will probably spend more time learning the ins and outs of the digital display, dividers, etc etc, than you do actually mucking in the circuit.

More than likely, the above will fail and you will next go to the PLL circuitry. Determine how the frequency setting circuit works and check that the digital/analog is doing what it should. Next will be checking the VCO, feedback path, lock conditions, etc etc. and determining where things go bad.

Steve - tnx fer your time on this. Will start checking these things out ASAP.
Have done some basic checks already, they (unfortunately) seem to point to a bad CPU....unless I missed something.
Dialling the main dial gives pulses on both up/down at CPU input, but nothing changes at all on any leg of CPU, except clock legs. Waveforms and timing look OK at first sight. CPU seems to have 4 address lines which controll the PLL and display driver, but these address lines never change status when I dial.

Now, I don't know if the CPU is just locked by some bad external component or if it's gone totally bad itself. uPD1511 is not that easy to find these days either...I cud really use a data sheet on the CPU, but can't find any. Without data, I won't be able to find a substitute CPU either. Ah well, I'll poke around in it for a while yet.....I cud always hardwire one or two channels :-) and manually fix the corresponding voltages for the PLL/VCO :-)

Cheers /Rick, SM7SCJ (fingers crossed)

Has anyone in this group had a problem receiving a
boatanchor paint order from NC Total Electronics?

I have sent two emails to confirm my order and to
date, I have not received a reply. It is now more
than two weeks since I have placed my order.
Thanks for any information that may help me.

Yea, getting the CPU i/o defined would help. It could be the CPU is relying
on an external input before it even starts doing it's thing. Tried to find
a schematic for the beast but with no luck. You might want to check the Vss
supply and other obvious things around the chip.

I'm pretty sure this is normal. Lot's of older radios were like that. I
have a Kenwood R-1000 and it reads ~1kHz high on usb, and ~2kHz low on
lsb. After a while you get used to making the mental calculations. ;->

Steve - I have full schematics here, but I am one of those non-TTL guys :-)
(prefer tubes)

Here's what I found so far:
Display is locked at 440.000.0
Rig RX:s and TX:s at 144.000.x but cannot be moved in frq regardless of what
I do with dial/buttons.

Up/down circuitry (seen from dial side) seems to work, as both up and down
chips deliver proper "counter"signals when dial is turned either way.
These signals are present at CPU input, and delivered there by the correct
chip (one for up, another for down).
CPU legs : CLK is constant high, LATCH is constant LOW. No life (constant HI
or LO, dont remember) in DATA line at all, no matter what I do. No life
(constant HI or LO, dont remember) in UP/DOWN pins.

Now, logically, if there is no Up/DWN, LATCH/CLK and/or DATA, the PLL
control CPU cannot control the PLL (which depends on all 3 for programmable
dividers to start working), and this is why the rig is locked at 144.000.0
Why the display is locked at 440.000.0 ? No idea (yet). Busted CPU wud hang
display, I guess - but I wud have expected all figures the same?

Most pins on connectors have logical life in them (except maybe the
CPU-dependant Mem scan/pri buttons and similar) - squelch works both on RX
and as logical signal on board, and the voltages I have measured so far are
reasonably up to par.

I still suspect the CPU to be dead. No memory functions (scan, PRI, MR etc
etc) can be triggered, nothing happens.

arghh....forgot to measure CPU supply voltage! Too late to go back to bench
now, will do that and also a complete chart of CPU legs/status tomorrow
morning.

Tnx fer ur time...

Cheers /Rick SM7SCJ (amateur faultfinder and technically/logically
challenged)

Go for it.

I'd like to see a 2-way boatanchor WAS. Where both rigs could qualify
for QCWA. How about an all-tube WAS, no transistors allowed.

I'll fire up my SB-101 and SB-200.

From: kludge@panix.com
Message-ID: <aritufmpn1@panix2.panix.com>
Source record: 36725

Does anyone have a schematic for the Plectron R5X3-40897 receiver? This is the small tabletop 30-50 Mhz receiver with no tone decoder, only standard squelch. Data on the later transistor Plectron boxes seems to be plentiful but information on any of the tube-type ones seems to be unavailable anywhere. I'd like to set this up to monitor one of the 6M beacons. It worked fine when I left it in my parent's attic 22 years ago, but digging it out this week, it appears to have some wiring damage that I am not sure I can repair without the schematic.

This us usually bad. Most CPU's need a clock signal running in
order to do anything. There may be a metal can with a crystal or
complete oscillator in it. I'd look to see where the clock signal
should be coming from.

NOW AVAILABLE ** New Program STUMATCH.exe"

This program assists with the design of stub-line transformers used for such purposes as matching the feedpoint impedance of radio antennas to the Zo impedance of the transmission line from the transmitter. The program is applicable to both balanced-pair and coaxial lines. These and similar types of transmission line transformers have traditionally been designed with the aid of Smith Charts. The superiority of this program in respect of time, operating simplicity, accuracy and user appreciation is clearly seen.

Download STUMATCH from website below.

Here is a possible solution. Go get some of the light rope that Wal-Mart sells. The stuff that is like parachute cord and less than 1/4" in diameter. The outer covering is woven just like coax shielding but out of heavy threads instead of copper. Maybe open that weave and use a thread from there. If viable you would have a lifetime supply from one hank of rope. Or use the individual strands inside the rope. Just a thought.

Is there any special reason why an ARRL-sponsored WAS (for AM or any other mode) is more valuable than one sponsored by some other group? Wallpaper is wallpaper. Isn't there a fellow someplace who will let you join an AM organization for $1? (I forget its name.) Maybe he'll print up some certificates and establish the rules for the AM WAS.

I was going to sesnd you over to the Heathkit circuit archives.
http://www.circuitarchive.co.uk/heath.htm
But they don't have that model listed.

Don,

I don't like it, I just report the facts. If you look at the
auctions, you will see that the power cords, mikes, and manuals usually
do come separated from the radios and power supplies. CW
filters very often are removed and sold separately from the
rest of the SB-101/2. Power supplies are removed from speaker
enclosures and sold separately. (Just like Heath did originally)

These folks own the radios. They bought them from widows for
$5 or $10 bucks, and then separated them up for ebay. It
has become a big business. Just look at the guys who sell
SB stuff on a continual basis.

How they sell them is pretty much their own business. Whether
you buy them that way, is your business. Me, I'd rather find
a complete station at a hamfest.

Another thougt. Is there a hardware reset on the CPU (not just power down and up)? If I remember there was a FT-780R as well. I am sure they had the same CPU. Your radio seems to think it is a 780R.

An Aussie HRO-5? How about that! I had one, missing some parts but with a good set of coils, and traded it to Bob Roehrig in Batavia, IL (K9xxx), who restored it. So there are at least two of these strange sets in the USA?

Speaking of Nationals, Bob also repaired the first NC-173 I owned, after I traded it to him. Since then I've gotten another 173. It's a nice feeling, nice looking radio with linear tuning scales (really -- take a look!). A 183D would be something to have.

But I really should get my HRO-60 working first. 73, Mike K. AA1UK

> ( a designated thief per Clark)

If you're subscribed to a service, which then, in turn, sends a signal down a
cable to a converter box, then into your television, then there's nothing you
can legally do, since you're bound by contract to that company, for it's
service.

When the signal supplier (the cable company) sends a signal, it's multi-plexed
at the source, and certain programs being fed into the multi-plexed signal are
scrambled, then there's nothing -legal- you can do to unscramble it.

*IF*, however, you were receiving cable signals off the AIR... afaik (as far as
I know) the only frequencies you can not -legally- receive is 800Mc cell phone
stuff. Cable Max used to be one of those -over-the-air- coble companies.

Why yes, it is so legal that he has to spell certain words with extra
p.u.n.c.t.u.a.t.i.o.n so search engines don't "hit" on them and rat him out.
I took them all out, so I hope this helps:

3933. PP-4763 question?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-23 00:04:38 UTC
From: K3HVG <jeepp@erols.com>
Message-ID: <3DDEC616.9037F563@erols.com>
Source record: 36606

I have 4 (yeah...4) PP-4763s. Three are "A" models and one is a straight one. These supplies will not carry a rig with high starting current (GRC-19, et al). I've tried the boot-strap battery trick, but the supply breakers are just too quick acting. I'm told that the straight model with the single circuit breaker does a better job. Mine may trip later, but not by much. My question (or idea) is, would it be feasible to bypass the breaker (and its control coil) and use some SB fuses, appropriately rated. Yes, the supply may sag, but it may hold until the dynamotor comes up to speed. I run one of my GRC-19s with a Marine Corps supply. Its sags down to about 20 volts, but recovers nicely. I wonder if the 4763's might be able to hack it with the above mod? Thanks for the read.

Source record: 36611

I have an old Galaxy III sitting here I would be willing to part with
for a reasonable price. I have the transciever, the ac supply, the
optional speaker cabinet/power supply enclosure, the original hand mike
and the operating/service manual. It is in rough shape, but it does
barely work. It receives poorly and does tune up just fine, but there is
no output audio. The consensus of folks more skilled in radio repair than
I is that the primary problem is that many of the resistors (and some of
the caps) have changed
value over the years and need to be replaced. With the comprehensive
detail in
the manual, this reworking should be no real problem for anyone with
basic soldering skills and the ability to use a vom. It is not real
pretty. The faceplate is clean, but the case has some scratches that
could be easily touched up. The speaker console has apparently be
dropped at some point and is out of square but should be easy to bend
back into shape. Again some scratches. I picked this up an auction as a
winter project, but I have not had the time to mess with it. I will let
the thing go for $75 plus shipping from Lincoln, Nebraska 68504. I am
looking for a 10 meter mobile ssb rig such as an HTX-100 or HTX-10, if by
some remote posibility you have one of those to trade.

WS 19, MK II

very nice condx, front is fine. slight moddification.

power and tel/mic connectors changed, extra control pot lower left but

easily removded. All other controls ok, some knobs different but not
really too great a prob to replace, internally looks complete, with
vhf section, all valves except back two in i/c sction.

not tested, s.a.s.

£60 plus postage.

WS19 control box No 2, as new.. £10

Ben G4BXD.

These are readily available.

One gentleman has been selling them on eBay, but can be found at
Caltronics, a California parts distributors.

http://www.caltronix.com/catalog/cat89.htm (near bottom of page)

Part number 50-131 (which is .625 in diameter)
I "think" the Drake knob was this size

They also have a 50-132 with is .750 in diameter

Sure, I can help.

There are about 6 different variations of the 12 pin
Jones Socket. Not including the 3 different pin
sizes used.

Next time you post, And I am sure there will be a next
time, post a simple ascii picture of the pin configuration,
and measure the pin width.

Cross-posted to: rec.radio.swap,rec.radio.amateur.boatanchors,ba.market.forsale

This radio has everything you need in one package. No linear necessary with 560 watts PEP input on SSB. Has full coverage of 80 through all four segments of 10 meters (no WARC bands tho). Built-in power supply, built-in speaker (a small radio speaker added in the top of the cabinet) and comes with a hand microphone. Plug it into the wall and hook it to an antenna and you're on the air. This radio works great, and I just checked the tubes and verified all of them 100%. Most are the original Yaesu tubes, except for the finals which are new RCA 6KD6's. I have also added a small whisper fan on the right side of the radio to keep the finals cool. Both the fan and the speaker can be removed easily if you want to return the radio to its original condition.

The cabinet is probably better than average, and the front panel is in excellent condition. Overall I'd give the radio an 8 out of 10 cosmetically. E-mail me if you want pictures of it.

I'll pack for free, you pay for shipping and insurance or can arrange for pick-up and/or delivery in Northern California.

Remove the caps to respond to the e-mail.

Dave Barnett

I just picked up an early Henry 2KD-5 linear. Anyone know of a place on line where I can download the owners manual? My usual search methods have turned up nothing.

Thanks for any help,
Al

4000. WTB: 6V6 metal version

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-24 22:57:24 UTC
From: Richard J <no_spam@please.com>
Message-ID: <arrlgpedr1@news.lth.se>
Source record: 36498

Hi group -

any tips as to where (preferably in EU) I can find a couple of 6V6 (metal can version) in good shape and at decent (low) price? I am thinking of building a "punk-ish" low-power guitar amp on a no-budget basis.

Also, I cud use some info on what preamp tube to use instead of 12AX7/12AT7 - is there a metal can version of this tube (or a similar dual-triode)?

You say - why metal tubes? Well, I want try something different... :-) - a tube amp that looks "industrial black-box" but sounds like an amp shud...

TIA /cheers /Rick, Sweden

4001. Re: REPOST: FT-480R repair help/advice needed

Funny tip, Joe - a rig with a split personality :-) - made me laugh to myself.....

But I'll look into it - not that I've seen any pointers to a CPU reset yet (have Yeasu schematic, but no datasheet for the CPU with looks custom-built (marked YEASU)...

OTOH, I've done some extensive checking on all CPU legs, and I believe it's alive. Its clock is actually running at 2,55 MHz or so, and most legs have "traffic" on them - but NIL happens when I dial. Now, this "traffic" still doesn't prove it's alive, but...

I think that something is preventing the CPU to run properly - there is no "traffic" on LATCH, CLK and DATA lines that go to the PLL unit. Bad ROM? If ROM instruxions are absent, the CPU wudn't know what to do when dial up/down is active - hence no change in display and/or PLL frequency. Basically, the CPU wudn't even "boot" (reset everything to 144.000.0) Is ROM inside CPU or external chip? Am I onto something here? Heck, I need a databook for all those chips....

Will look into it during next week, time permitting. Tnx fer the tip, Joe :-)

/73, Rick

You do NOT speak for everyone here. This is a public, unmoderated
board.
Starting a fight about clearly marked posts is NOT welcome here.
We finished this argument on this board a very long time ago
and people were gentlemen about it.
The people here are grown-ups who know how to simply ignore
or filter what they do not wish to read.
Please do not start any more pointless FA fights here.
If you don't like it, don't read it.

4010. FS: Radio Amateur Callbook, Spring 1949

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-25 03:10:27 UTC
From: Tim Richardson <ter@bellsouth.net>
Message-ID: <5053uukh3khjovcfqtd4stconh2d82ukom@4ax.com>
Source record: 36681
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.swap,rec.radio.swap

'Radio Amateur Callbook' Spring 1949
$15.00

In addition to all the US ham callsigns, this callbook includes a lot of old advertisments from the good old days of ham radio.

You can view a scan of the callbook at
<http://www.pbase.com/timrichardson>
Just click on the 'ham_radio' gallery

The callbook is complete but NOT in pristine condition. It is yellowed, has some water stains, edges and corners are worn, some tears, bent corners, musty smelling and the covers are in pretty bad shape and about to fall off as you can see from the pictures.

U.S Shipping & Handling:

$5.25 (Priority Mail)

I accept money orders, cashier's checks, personal checks (allow up to ten days to clear)

Contact Tim Richardson <ter@bellsouth.net>

Just click on the 'ham_radio' gallery

$5.00 each unless noted

If purchasing more than one magazine, take $1.00 off each additional magazine.

All magazines are complete but are NOT in pristine condition. All are yellowed, some have water stains, edges and corners are worn, some tears, bent corners, spines are very worn on most, musty smelling.

U.S Shipping & Handling:
$2.75 1 magazines (1st class)

$4.50 2 or 3 magazines (Priority Mail)
$5.25 4 or 5 magazines (Priority Mail)
e-mail for other rates

I accept money orders, cashier's checks, personal checks (allow up to ten days to clear) or PayPal for amounts of $20 or more.

Im with ya
The guys that rip prized possession station of a SK for an extra couple $$$
really piss me off !
These pimps should be jailed for rape, robbery and taking advantage of a
widow or unkowing estate holder.
"Ill give ya $200 for all them old tube radios"
One guy ripped apart a Kenwood TS-430s to FA all AM and CW filters, FM board
each seperatly on 5 posts
I agree with you, its so abusive and out of control its discusting.
rec.radio.swap has this guy "rlucch" running a full blown bussness ripping
up estate gear to FA
These people ruened the hobby,

Equil time:
I equilly blame all the cheapskate penny pinchers slobs for discouraging
sellers.
Think of it this way:
At least the gear goes to somone (the highest bidder)
He or She is usually someone who really wants and will take good care of
preserving it.
I seen to many slobs treat gear so lousey its a shame

-Elvis

4014. AR-8503 LF receiver listed on eBay.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-25 04:02:02 UTC
From: Terry <tsanford@nf.sympatico.ca>
Message-ID: <3DE1A0BA.2B06A6C6@nf.sympatico.ca>
Source record: 36685

Have noted listed on eBay an AR-8503, so called 'Spy receiver' of W.W.II vintage! Have reason to believe not so!

The RMCA (Radio marine Corp. America) Model AR-8503 low frequency receiver is described in Chapter 14 of "Radio Communication Principles", first published in 1935 by McGraw Hill, as a compact medium, low and very low frequency receiver, primarily for marine applications.
It used 'metal' octal (6K7 RF, 6K7 Det*., 6K7 AF, and 6F6 OP)
Ranges 15-40,40-100,100-250 and 250-600 kilocycles. *
Regenerative detector.
Shown as powered by an external power supply or by battery supplies of 6 volt, 90 volt and 22 volts. These were connected to a vertical row of four externally mounted terminals on right of the front panel.
The eBay item advertised has probably been modified; there is a wire with an AC plug coming out of a hole which originally contained one of the head phone sockets. Thus suggesting that an internal power supply has been added? The text also mentions a 15 ohm 'drying resistor' on the underside of the chassis to keep components dry. Description also mentions the front panel 'door' to provide access to the tubes!
As described there was no output transformer; to quote the text "The plate current of the second audio stage (the 6F6) is carried through the telephone receivers (i.e. headphones), and for this reason it is important to use the correct polarity of the telephone cords to prevent demagnetization". Also means the headphone leads could/would be hot at the B+ of 90 volts!

Have no connection with or knowledge of the seller. Not being an eBay seller myself cannot communicate directly to pass along the above.

Terry.

PS. Regenerative detector receivers of that era were not immune to radiating slightly. Also that's one reason some later designed superhets had one or more RF stages to prevent local oscillator radiation.

4015. Emerson (Q) 157 chassis needed

Newsgroup: rec.radio.amateur.boatanchors

A pal (bobwiz@aol.com) has a good cabinet and knobs. But no chassis for this TRF midget that Mallory notes has:

6C6, 6D6, 25Z6, 25L6.

The chances of finding these "guts" are so remote I'm almost embarassed to use the bandwidth

But thanks!

Marty

TRW Goodies for sale......

I have lots of items for sale please view them below. I will take them to TRW swapmeet on SATURDAY November 30, 2002. The TRW swapmeet is in the city of Redondo Beach, CA. Time 7:00 -11:00 AM. LOCATION is on the corner of Marine Blvd, and Aviation Blvd.

I have for sale some Handheld, and Mobile radios MOST of them have only been turned on once or twice.
EXCELLENT condition.................

Icom 207 H 144/440 MHz mobile transceiver with original box "LIKE NEW" $220.00
Icom 2000H 144 MHz mobile transceiver with original box "LIKE NEW" $100.00
Icom 281H 144 MHz mobile transceiver with original box "LIKE NEW"...$100.00
Icom V68 handheld transceiver with original box "LIKE NEW "....$100.00
Icom T7A 144/440 MHz handheld transceiver with original box "LIKE NEW"...$120.00
Icom W2 144/440 MHz handheld transceiver with the original box in good condition...$100.00

Radio Shack HTX-202 144 MHz handheld in the original box "LIKE NEW"...$90.00
Radio Shack HTX-204 144/440 MHz hanheld in original box "LIKE NEW" ...$150.00
Radio Shack HTX-212 144 MHz mobile radio in original box "LIKE NEW"...no mic $80.00
Yaesu FT-2500 144 MHz mobile radio in original box "LIKE NEW...$100.00

Kenwood TM-255A 144 MHz all mode transceiver in original box "LIKE NEW" $450.00
Kenwood TS-790A 144/440/1200 MHZ all mode transeiver very good condition $1100.00, and it does have the 1200 MHz module.........

Heathkit SB-221 amplifier is nice condition $485.00 with heavy duty box

Collins 312B-4 winged emblem station console great condition...$250.00

Bird 250H $50.00
Bird 100H $70.00
Bird 100C $50.00

Yaesu SP-102P Phone Patch/Speaker.....$89.00

Yaesu FC-707 Antenna Tuner...........$90.00

aesu "Brand New In The Box" MR-7 Rack for the FT-707....$30.00

Yaesu "Brand New In The Box" FRB-707 Amp/Relay.....$29.00

Yaesu FV-101Z FT-101ZD Matching External VFO.....$75.00

Yaesu FF-501 TVI Filter.....$20.00

(2) Yaesu Landliner Speaker/Phone Patch.....$50.00 each

Ten Tec # 4229 antenna tuner $99.00

PAL 120+ 12 Volt Tube Amplifier.....$70.00

PAL KW-1 SWR/Watt Meter.....$30.00

Heathkit SB-614 Scope.....$80.00

Mirage B-108 2 Meter Amplifier 10 watts in 80 watts out.....$75.00

Bencher Keyer BY-2.....$60.00
"It sell NEW for $125.00"

Ham Key $40.00

Heathkit SA-5010 u Matic Keyer...$4000

Nye Viking Straight Key....$40.00

AEA MorseMatic....$65.00

MFJ - 1278 TNC, Multi-Mode CW,SSTV,FAX,RTTY,AMTOR,ASCII, NAVTEX, CONTEST
MEMORY KEYER.....$89.00

(2) MFJ-1272B TNC/MIC Switch.....$10.00 each

Heil HM-10-5 Desk Microphone Wired For Yaesu.....$70.00

Rig Blaster.....$50.00

4034. WTB: I.F. transformer for Gonset G-66B

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-26 01:46:27 UTC
From: John Morris-WB&#65533;RLD <moe@email.msn.com>
Message-ID: <uSYbZZQICHA.1348@cpimsnntpa03>
Source record: 36509
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap

I really did it this time.

While peaking the I.F. T-3 (265kc) of my Gonset G-66B receiver, I didn't notice that the whole form was turning along with the slug. As you can imagine as I turned the slug (and form), all of the wires ripped off of the terminals and several on one coil broke off right at the surface. This is one of those instances that you just close your eyes, grimace and can hardly look at the damage.

I couldn't find the inside broken wire of one of the coils so I slid the thing off of the form and all heck broke loose. Bad to worse.

Does anyone have a G-66B parts rig that has one of the 4 - 265 kc IF transformers I could purchase (T-3, T-4, T-5, T-6)?

Thanks in advance.

John - WB&#65533;RLD

> You say - why metal tubes? Well, I want try something different... :-) - a
> tube amp that looks "industrial black-box" but sounds like an amp shud...
>
> TIA /cheers /Rick, Sweden

In case you don't find the 6V6s, is there any reason why you couldn't
run 6L6s (much easier to find, in my experience) at the same lower
voltages? Or am I just proving that I'm clueless when it comes to
guitar amps?

Regarding metal dual-triodes, there are none of American design (not
enough pins in an octal base) except for the 6SC7 and 6N7, which have
a common cathode. An alternative single triode would be the triode
section of the 6SQ7.

73,
Mike, KK6GM

Hi

Can anyone help with instructions for this early quality UK built tester or give some idea of its date? It is similar in size and appearance to an AVO 8 Multimeter, but with more switches.

Thanks

Simon

4038. F.S. Gonset GSB 100 and GSB 101 Kilowatt Amp

Newsgroup: rec.radio.amateur.boatanchors

For Sale: Gonset GSB-100 SSB/CW/AM Transmitter.
Specs: Input Power 100 watts SSB / 100 watts CW / 75 watts PM / 50 watts AM
Freq: 80-40-20-15-10 meter bands
Excellent VOX for voice and break-in CW.

This unit has had the power supply converted to solid state as well as a new power transformer installed. The Achilles' heal of the early Gonsets was the power transformers. You don't have to worry about this one going bad. The original manual is included.

For Sale: Gonset GSB-101 Kilowatt Amplifier
Specs: Power Input 1200 watts PEP (SSB) - 900 watts (CW) - 400 watts (AM)
Freq: 80-40-20-15-10 meter bands
The GSB-101 is the matching kilowatt amplifier to the GSB-100 transmitter.
It runs four (4) 811A power tubes
This unit also has had the power supply converted to solid state and a new transformer installed. Here too the power transformers were the weak points.

The GSB-101 forms an ideal companion to the GSB-100 but will work well with any exciter capable of approximately 75 watts of drive.
Cosmetics are very good. The only scratches are slight ones around the case screws. I have run this amplifier on several occasions and it works as advertised.

Original manual is included.

Price for both: $350 firm

Separately: GSB-100 $175 /-/ GSB-101 $200

Shipping is at buyer's expense or pickup near Seattle

John; Just a thought from one who seems to always be scrounging IF transformers.
The older car radios, ie: analogue tuning, used 262 KHz for their IF frequency.
I usually pick them up at yard sales for less than a buck. Keith, VE3JKC.

Mike, tnx for solid info and spending your time on this.
Clueless w/r to guitar amps? No, you are right, and actually I'd prefer 6L6 because they generally sound "warmer" and have nicer "breakup" when driven hard, at least in glass versions. I just had this metal 6V6 and decided to use that one for starters. They have basically the same pin config and ratings, so I'd like to play 6L6 too, can easily do that on same chassis without mods. Problem is where to get them in metal can version.

Tnx for data on triodes - now I know where to look. Common cathode won't work, so I will either skip one triode or use a single triode or a triode/pentode or something, we'll see.

Cheers /Rick

Hi, Rick--

I've got a couple of good metal 6V6's if you decide to pick that type. AES wants $15 each for new. You can have these two for $10 total plus shipping. One is new, the other used but strong.

I tried to email you but didn't know what to delete from your "no spam" address and my message bounced.

The cheap 70V PA system distribution transformers will have about a 500 ohm
input on the 10W tap. If you want 5Kohm in, you're talking about a direct
output transformer and you need to know if you want a wet or dry one. Hammond
makes some cheapies.

I posted earlier asking if anyone might have data on the low-band VHF Plectron R5X3-40897 monitor receiver. This is a tube receiver with one crystal and no tone detection, just conventional squelch. I got a few people back asking if I had any photos. Well, now I do.

Check out http://www.panix.com/~kludge/plectron.jpg for three nice photos of the receiver. Detail isn't good enough that you can see the broken diode and missing wire from the squelch control, though. There is also clearly a missing connection from one leg of the speaker to the squelch relay.

Source record: 36528

I use them for recording since the wont hold up long, I found some metal 5V6's and 6V6's.
Problem is in the combo amps the speaker's rattle the guts of the tube apart to easy (those metal tubes)
You have to turn down to 11 if you want them to last and that defeats the reason (to saturate the output circuit) for rich string touch sensitive power tube distortion.
The old round with dog logo RCA 6V6 sound the best. (to refined for metal scratch punk)
For preamps 12AX7/7025's or FET-TRONS is the best if you can find "good ones"
>>>(preferably in EU)
Haa ....I like them also but 8 out of 10 off the line are to microphonic for high gain cascade preamp application.
You have to float them on sockets with O rings inside the covers on the springs as dampers.
.........Squeeeeeeeeee !

Hi Folks,
A friend has acquired a FRR60 receiver by Technical Material Corp, The whole unit is in perfect condition and the rear connections have all been labelled, however the unit just wont power up...goes onto standby fine, but blows fuses when set to operate. Unfortunately we have no info at all on this beast, could only find one site on the internet, and we urgently require schematics or any other info.
If anyone knows anything, please help!!
With thanks

Dean, 73

Old Ed of Edlie Electronics in Levitown NY had buckets of them from
Lafayette 5 tube 50C5 radio kits.
Also some R-390s I bought
Ed had some BS going on (landlord ?) over rent or wanted to rent ....I don't
know .
Ed packed it all in
Its all been going on Ebay user "edlee" I believe. If you find him they are
the small 5K to 8 transformers with wires black green + red blue. I baught
the last of the 600 to 8's in the spring (but they go with my R-390
restores)

Pull the rectifiers out. You might have a 5Y3 or a 5U4 that's shorted.

with them out, then try it again - if it don't blow the fuse, then it's in the
B+ line.

Five bucks, maybe ten. It's pretty much useless if you don't have the
microphone that went with it, unless there happens to be something
else wideband in that range you might want to listen to. I suppose
you could listen to the point to point broadcast remote services, if
any of those still exist anywhere.

I hate agree with Scott, but he's right.
Vega wasn't too bad, but this only is quite old and even if you had the matching mic transmitter, this frequency range is rarely used anymore (other than cheap radio shack types). But if you find the mic, and it works for your needs, what the heck

Sadly the cheap Radio Shack types operate at 49 MHz, and can't be tuned
in with the Vega receiver. Since the receiver is very wideband in order
to get good audio quality, it is also useless for 10M FM and for listening
to low band land-mobile even though these are covered.

> "Wet or dry?" That's a new term to me. What does it mean?

Whether it has DC offset on the primary or not. For example, the AA5
table radio uses a single 50C5 output tube with the output transformer
in the plate circuit, so all the plate current is passing through it.
A standard transformer would very quickly get magnetized and be useless,
so we use a wet transformer with the core cut so that it doesn't saturate
with all that DC. In the catalogue, transformers should be rated by
allowable current.

I got one from antique electronic supply in Tempe AZ, and am using it in a Hallicrafters R46 to connect to an sx-42. I'm not sure if there's a proper way to mount the xfmr in the speaker cabinet. The hallicrafters speakers that come with a transfomer have the xfmr mounted on the metal part of the speaker. I used the screw holding on the feet (pads) of the speaker to hold down the xfmr.

Source record: 36545

I have an audio transformer that I bought from Antique Electronic Supply a couple of years ago to match an SX-62 500 ohm output to an 8-ohm speaker. It's a Hammond rated at 12 watts with a frequency response from 30-20,000 hz. The catalog says it was developed for the Collins Collectors Association. The model number is: P-T119DA, and it sells for $18.32 plus shipping.
It's not an exact match, but it works fairly well.

I have no alternative since I can't find new 500 or 5,000 ohm speakers.,

Antique Electronics is in Tempe, Ariz., 480-820-5411.

The SX-42 has both 5000 and 500 ohm outputs. I don't know what purpose the 5K output served, but they went to great lengths to keep you from getting your fingers across the terminals! That PITA spring-loaded snap cover ...

I doubt that the usual 70-volt "line" transformers have a tap that goes up to 5K ohms. Anyone know? Anyhow, we just use the 500 ohm output, about the same as the 600 ohms on the miltary-industrial receivers.

I do have one of the "Darth Vader" SX-4 speakers, and am trying to remember if it uses the 5K feed on its built-in xformer.

The good thing is that you've done it entirely reversible -- drilled no new holes, so you can always do it "right" later on and leave no trace.

The 5K output comes directly off the plate of something?

>5K ohms. Anyone know? Anyhow, we just use the 500 ohm output, about the same
>as the 600 ohms on the miltary-industrial receivers.

No, the 70V stuff won't go that high. And you won't find too many transformers
out there that do, except for transformers intended for push-pull output stages
with center taps, and wet transformers intended for single-ended output
stages.

Just using the 500 ohm output is fine.

>I do have one of the "Darth Vader" SX-4 speakers, and am trying to remember if

If it's a wooden case speaker, you can screw it onto the back panel, otherwise
you can bolt it inside the case. If it's inside, mark the speaker that it
is set up for 500ohm input.

For some reason, I can tune to listen LSB signal from USB mode and vice versa on my old shortwave receiver. Is this normal ? I always thought that LSB signal can only be tuned (or clarified) on LSB settting and USB on USB setting. Otherwise, what is the point of having both LSB and USB mode labels ? Also, is there typically one filter for both sidebands ? I would appreciate any comment or explaination on this subject. Thanks in advance.

Exactly right Pete, I block the sender. After blocking about ten of the
worst
offenders, the newsgroup is remarkably clear. Unfortunately, most of
the discussions regarding boatanchor restoration and collecting is long
gone from the group because of the mismash of garbage.

Pete

4085. Does the R-390 registry still exist?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-27 21:51:59 UTC
From: Jerry McCarty <microtv@umich.edu>
Message-ID: <48bF9.1278$ho1.87411@news.itd.umich.edu>
Source record: 36558

The link given on http://www.fernblatt.net/mi.html bounces email back.
Does anyone know if the registry still exists and how to access it?

Now quit reading this and get back to eating turkey and watching football.

The r46 is a metal box. I've also got an R42 which is 500 ohms & hooked up to an sx62a. A Darth Vader speaker sounds kind of nice, but I've got no room left. Also its getting hard to lift these things. I intended to put an r390a on my radio desk in place of a 51s1 which seemed lacking in selectivity, but at the time I didn't have the energy to lift it up and carry it over there, so I took a light weight drake r4b over there for the time being. I'm going to do stretching exercises this week and move the r390a.

Peter posted:
<< For some reason, I can tune to listen LSB signal from USB mode and vice versa on my old shortwave receiver. Is this normal ? I always thought that LSB signal can only be tuned (or clarified) on LSB settting and USB on USB setting. Otherwise, what is the point of having both LSB and USB mode labels ? Also, is there typically one filter for both sidebands ? I would appreciate any comment or explaination on this subject. >>

It would help to know what is your radio, so the reply could be more in context.

Your receiver apparently has a fairly wide bandpass (6 kHz more or less). Given that, if you tuned in a USB signal and then had the station change to LSB, you would hear it clearly without retuning your receiver. That's kind of handy. The penalty of that, however, is that the wide passband causes you to hear twice as much QRN and QRM.

In a modern receiver the passband for SSB is 3 kHz or less, and the beat frequency is placed precisely at the best location in the filter's passband to permit you to tune for the best intelligibility. Because of this you must usually select to tune either USB or LSB to match what is actually being transmitted. The benefit of this is reduced QRN and QRM. But it's also why there is a "gentlemen's agreement" among Hams for which sideband to use on which band.

SSB is a great technology, but it is an anti-social form of casual communications unless you have agreed to meet someone at a specific frequency and specified the sideband.

Don

The receiver could be out of alignment -or- on many older receivers the
USB or LSB marking is simply a BFO setting and depending on how you tune
its not all that uncommon. What kind of receiver is it?

-Bill

4089. Re: Question on LSB/USB signal

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-27 22:34:27 UTC
From: Chuck Harris <cfharris@erols.com>
Message-ID: <as3ha7lip1@bob.news.rcn.net>
Source record: 36562

Peter,

Ordinarily, a SSB receiver's filter is designed so that
the BFO is tuned to a few hundred Hz outside of the passband
of the filter. When upper sideband, the BFO is set below the
filter bandwidth and when lower sideband, the BFO is set above
the filter bandwidth.

Your old shortwave receiver either has ineffective filters, or
is aligned so that the BFO is inside of the passband of the
filter. Either case is not ideal for SSB reception.

-Chuck, WA3UQV

Hi Group.

A friend of mine picked up an old scope at an estate sale.

This thing is right out of a Frankenstein movie.

It's a Browning Laboratories Ocillosynchroscope model OL-15B .

I would like to find a manual and schematic for it so that I can restore it.

(I know, I'm weird.)

Thanks!!!!

Mike

Have an SP600 JX-21, that I thought was all done up fine. I checked tubes (one shop in town still has a front window tube tester!) and put the best ones in. Had to replace the S-meter movement with a 100 ma unit.
Now, when BFO and AVC are on, the S-meter reads full scale, or nearly so, on next to no signal. Is this typical or does it have an open cap or two between the 6AL5 and the meter? There were NO black beauties in it... all mica and ceramic.
Any notions?
Nelson

To email, delete the obvious...

I haven't had a Super Pro in years, but I think this is normal.

The AGC is reacting to the strong BFO signal, and the S-meter is
measuring it. There is no product detector; when you turn on the BFO
the AM detector is still being used.

There really is no difference, in terms of AGC voltage, between
the locally generated BFO and if a strong signal was coming in on
that frequency through the antenna.

This is why, when you have an old product detector-less receiver,
the prescribed method of receiving SSB is to turn off the AGC,
turn up the volume control, and use the RF gain control to
adjust volume.

For sale - rather rare Globe HG-303 novice transmitter. Mint
condition.

6146 final for 75 watts on 80, 40, 20, 15 and 10m bands. CW only.
Has metering for plate and grid current.
Standby-Operate-Tune switching etc.

Comes in the original box with manual.

Looks just like new and operating fine with full output.

Picture at:

http://home.cfl.rr.com/happysurfer/imag/globe_hg303.jpg

Will sell for $135.00 plus shipping

Excellent comparision. So, if a newspaper went to 95% advertising,
would one continue subscription, or cancel it? If a local radio or TV
station went to 50% advertising time, would one continue to support
the station by watching or listening? Same here. All that is left is
FA, FS, WTB or similar postings, and little else of merit.

Of course, If this line of discussion in a discussion group bothers one,
he is welcome to skip over it as well.

To quote you: "Most of what I see has FA in the subject line." Ditto.
That's all that's left.

Regards

Pete

4102. Info Racal RA6775-14 Receiver

Newsgroup: rec.radio.amateur.boatanchors

From: Nico van Dongen <nico.vandongen@compaq.com>
Message-ID: <xwpF9.6$is.220279@news.cpqcorp.net>
Source record: 36575

Hello,

I recently bought a Racal RA6775-14 remote controlled receiver that proved to be faulty.

When switched on, the fault lamp lights and with the meter switch in the 20Volt position the meter shows the 20 volt being 3 volt.

luckily this receiver is a dream to trouble shoot and one by one I disconnected the modules and apparently the BFO module is clamping the 20Volt, I reckon by an internal short.

I haven't had time to investigate further so far but I would like to know if someone has knowledge of typical faults in this kind of receivers

I don't have the remote control unit but got a software program to control the receiver over a serial line with the set, any experience with that?.

Can someone tell me if the receiver quality of RA6775-14 is any good? Also the extension -14 must mean something I recon.

Regards,

Nico PA3ESA

Aww, good! All you need to do is shunt the meter so it reads 200 uA
FS. That should solve your problem with the meter being too sensitive!

And of course, advertising in newspapers and magazines, and on TV and
radio, are paying for the content. The advertisers are paying because
they know the content will deliver readers and viewers to their advertising.
I suspect we are tolerant of that advertising, within limits, because
we know that the ads lower our cost to see the content.

Here, the ads aren't paying for anything. If the posters of ads
had to pay, the "free" advertising would go away, and they might rethink
whether or not it was worth posting to a discussion newsgroup.

No, people advertising, and as I've said before I don't particularly
make a distinction between simple forsale ads and auction ads, do
so because it's costs them nothing more than their internet access,
and they hope that by posting to a discussion newsgroup they increase
their chances of someone who would want the item seeing the ad.

To "me", so far as this newsgroup is concerned, the FS/FA ads aren't plentiful to the point of causing a problem -so long as they are within topic -not sex, breast enhancers, etc.. But that is "my" opinion. But as I alluded to earlier, those not in my interest, I skip over. I've probably posted an ad or two in here myself. Funny thing is, there is a newsgroup which I'm sure most of you are well aware of called "Rec.Radio.Swap and there was some one recently bitching in there about FS and/or FA ads of radio and related gear. I and apparently others - thought that was the purpose of that group. So it seems no matter where you go, someone is going to be pissed off. Sometimes you just can't win! TECH@DP.NET

Lou posted, in part:
<< To "me", so far as this newsgroup is concerned, the FS/FA ads aren't plentiful to the point of causing a problem -so long as they are within topic -not sex, breast enhancers, etc.. >>

I share that view. I've made purchases from FS posts here. The most recent arrived yesterday - a very nice old 6 meter transceiver. I wouldn't have gone to ebay to look for one, but the post was well done and caught my imagination. It came with no extra charge for the cords, xmt xtal, schematic, etc. Like in the "good old days."

Don

I'm sure you know that this entire argument is moot.
This is a public, unmoderated board.
It is exactly like a "public notice" posting place on a picket fence,
which was common in the past.
You have no power over what is pasted up, and you never will.
You do have power over what you read.
Standing at the posting place and throwing a fit only makes you look
bad.
The other folks are standing around reading what interest them
and ignoring what doesn't.
They wish you'd knock it off and stop disturbing their peace.

If you want to set the rules, get yourself some web space and
open a chat board. You and 2-3 other FA haters can pat each other
on the back FA free and repeat the same stuff over and over.
The rest of us will enjoy each others company,
free from your pointless carping.

D.S.

> "C'est un Nagra. C'est suisse, et tres, tres precis."

70 volt line transformers are 5000 ohms per watt, so the one watt tap is 5,000 ohms. If the 5000 ohm output is a secondary winding it may have been intended to allow using several speakers with the receiver, by adding line transformers to the speakers. It would be useful for long speaker lines, to reduce resistive losses. Not something most users would ever need, but it could come in handy at times.

Also, anyone who would not like to see FA listings here or elsewhere should learn to use a filter so you don't "have" to see them. There are several other newsgroups that I like to read. Some have individuals whose posts I do not care to "see" for various reasons, language etc. My life is much better using filters!

4117. AN/ARC-2 Variants?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-11-29 02:57:10 UTC
From: David Stinson <arc5@ix.netcom.com>
Message-ID: <3DE6D786.5472580E@ix.netcom.com>
Source record: 36590

I'm doing some research and stumbled on this information:

AN/ARC-2, built by Collins and by RCA, first acquired by the navy
in 1944, 40 watts, 2-18 MC, 8 preset channels.

AN/ARC-2 (XN-1), built by Collins, first acquired by the navy
in 1943, 50 watts, 2-9 MC.

Anyone have any other information on these variations?

Small speech here...
Since I was nine and wrecked my Dad's radio (then tried to rebuild it)
I've tinkered with tube stuff, and some solid state, off and on. Got going
again fairly recently, which has prompted all the questions about the SP600.
I'm thankful I found this newsgroup.
I'm thankful for all the help and wisdom and references you guys
provide. And even the email counselling I get.
I'm thankful for all the websites you collectively cite, and have
plugged a huge number into "favourites" subfolders. The amount of knowledge
available just for the asking is mind boggling.
I'm even thankful for the occasional FA post, because some of them are
very interesting.
And it's not even Thanksgiving here in Canada!
In short, thank you, everyone!
Nelson

For Sale: A very, very nice Heathkit HW-100. Great for the collector or for an inexpensive first rig. Comes with the Heathkit HP-23 power supply and the cable that fits between the supply and rig. I have also purchase a W7FG Vintage Manual for the HW-100 for about $40. I'll toss that into the deal. The rig has two NEW 6146 finals and a new 6CL6 driver. I will toss in the spares. Very good condition...no dents, no rust, original paint, original knobs. Comes with TWO mics, one the original Heathkit hand mic and the other a Turner mike that looks just like the Heath mic. Works great! Received excellent reports from all over...both audio and signal wise.

$295 and I will pay for the shipping and insurance. If you're short on cash, we can run the transaction through my ham/swl business using your "plastic".

You're also welcome to call if you want further info.

First e-mail or phone call gets it!

From: Paul Mendes <pmendes@concentric.net>
Message-ID: <as82ci$s7i@dispatch.concentric.net>
Source record: 36452

Hello,

I have the following for sale for pickup only.

Location: Smithfield, RI 02917

Cash only.

Photos available.

Hallicrafters SX-28A (SX-28-A) with R12T speaker. I will not sell them separately.

The receiver was gone thru by Bob Eslinger (www.oldradiodoc.com) a few years ago.

This radio receives fine and sounds great. The speakers grill cloth is not original.

I have copies of the military and civilian manuals.

I'll include as a bonus a working SX-25 with a manual and PM23 speaker.

$500.00

Thank you for reading.

Paul Mendes

I have found that these people can wind you a new power transformer to
spec probably cheaper than a rewind job. Expect $55-65.

http://www.heyboertransformers.com/index.shtml

You might also want to check the list at

http://www.oldradioparts.com to see if he has one that you can use.

It doesn't appear to me that Dave Stinson (ARC5) has a problem with anyone's opinions, only with their actions. I also think it's despicable that a few anti-ebay bullies get on here and tell the newbies their version of the rules, when the rules are published and available for anyone to read (and do not support the anti-ebay position by any reasonable interpretation). If the bullies would stop their bullying, the whole thing would likely die.

If posting an opinion on here
is "bullying", so be it. The fact remains, abusing the system
turned what was once viable discussion board into a community
corkboard for eBay teasers. Take the same advice Dave
gives, if you don't like it, ignore it. I'll continue to post my
opinion.

I get sick and tired of this lying bullshit.
You twisted a-holes are constantly harping that line,
and anyone with a working brain cell and the ability
to count knows better. There are LOTS of discussions
going on here, but your sick little minds only see
what they want to see. Go back to r.a.r.+p
with the other members of your little gang of thugs.
People don't need your poison here.
D.S.

over here.

It's odd you should talk of "bullies" because the way I see it, people
who talk of "anti-ebay bullies" or use the loathsome term "net-cop" often
are the bullies, because they want something and will do anything they
can to get their way.

Some of us were around when this newsgroup was created. I remember the
debate over ads. At issue was that even in 1996 some sites didn't want
to carry commercial traffic, and if ads were in the newsgroup, the newsgroup
might not be carried to those sites. On the other side, were the people
who were making a big deal about how buying and selling was integral to
their hobby and they needed to be allowed.

Some of us have read "the rules". You might want to check out the newsgroup
creation message at:
ftp://ftp.uu.net/archive/usenet/control/rec/rec.radio.amateur.boatanchors.Z

Note that it has very little to say about advertising, not because it
doesn't matter, but because this was supposed to be a discussion newsgroup
(and yes, ultimately the reason ads aren't specifically denied in
newsgroup charters is because there is an overriding restriction on ads
except for specific newsgroups).

"The newsgroup, rec.radio.amateur.boatanchors, is primarily for
discussions of topics related to classic amateur radio gear."

There's a lovely long list of what is suitable for classification as
a "boatanchor" and what is on-topic here. And one line about ads.
Surely all that defines what this newsgroup is about, discussion,
and not some buy and sell newsgroup.

What we really see too often is a buy and sell newsgroup. People who
don't post discussion come here to sell their junk. Then, as I've
said before, others come here to sell their junk too, but it's even
more removed, like those TS-830s, and then even more removed, like
those computers and hi-fi equipment.

Note the very specific prohibition against cross-posting between rec.radio.swap and this newsgroup. Don't call us bullies if you haven't even read the rules.

On one side we have the people who feel it's their right to sell stuff here, which of course is natural since they want to sell stuff. On the other, there are those of us who come here to see discussion, and for a lot of these six years have been too often disappointed by the lack of it. Concern about the space we inhabit does not make us a bully.

You're not responding to what I said. You are twisting the facts to support what you want to support.

If you send a newbie a caustic email telling him he can't post a boatanchor for sale here, and report him to his ISP for off-topic posts, that is bullying. That is what is going on here.

Your points do not support your argument. Posting of a computer for sale here is off-topic. Posting of a discussion of computers here is equally off-topic. Posting of a boatanchor for sale (either directly or via an auction) is on-topic.

See how simple it is??

Good evening group....am trying to modify a Kenwood MC-50 desk mic to work with my Yaesu FT-900....the ft900 uses a RJ-45 type of mic connector, and I don't see a big problem adapting that to the MC-50s 4 pin type connector...my question is about the 8 volts I see in the Yaesu diagram to the mic....is that necessary for just barebones mic function...I don't desire the up/ down function that is available with the original Yaesu desk mic designed for this radio, just a decent desk mic, so I don't have to hold the trigger on this hand mic all the time...if you e-mail me directly please remove the (NS) from my address...Thanks to all.....Bob

RAR+P is the Rec.Antique.Radio & Phono newsgroup. One of the few
discussion newsgroups that has so far remained that way, no thanks
to Stimpy Stimpsons efforts. BTW, I have seen posters ask boatanchor
questions on both groups... 90% of the time they only receive advice
on RAR+P, albiet off-topic.

Have a look at: http://www3.sympatico.ca/bernard.murphy

There are some metal tubes for sale at a good price. 6V6 metal tubes are quite rare.

Look at N7JP's tube site: http://hereford.ampr.org/ (it will give you some good ideas on subs)

Have a nice day.

Regards,
Bernie

6V6, which is the metal tube, are very common in the states. They sell
for a few dollars less than the metal versions. 6V6G with the
ST shaped bulb are rarest (usually price on request!),
while the 6V6GT is in high demand by the audio
crowd. The big "users" of the 6V6 metal were early RCA and GE radios,
since
they collaborated to produce the metal versions of many common tubes.

For most other sets, collectors prefer the glass versions for their
asthetics.

BTW, since you are in Europe, why not contact KWtubes in Lithunia, he
carries the Soviet military equivalent of the 6V6GT for a very decent price;
so much I use them in my early radios where the ST style isn't needed.

Hello All -
I would like to get some opinions from you about the capabilites of the TMC GPR-90 receiver. It looks to be very well built but how does it compare with other receivers of the same period in terms of performance? Sensitivity, selectivity, audio quality, dial accuracy, etc? Thank you.

Regards,
Bruce

Let's see...
I count 79 messages in the latest download of this group.
There are 32 threads which are either discussions, direct sales
or WTD, with which you say you have no problem.

There are NO FA posts.... None.... ZIP.

I wonder if those people who are holding discussions here
should check with you FA-haters first, just so they know
they're "overrun."

So much for who's a liar, Uncle.

Go on back to the other group and report in
to your masters, the twin fairies Alan (still living with mommy at 45)
and Peter W. Let them know that yet another attempt to
spread their hatered to r.r.a.b. has failed.

Need some coils for the Collins 18S-4 radio set. Any frequency is OK.
I need the 2 receiver coils and the transmitter driver coils. These are
tunable coils and have a single pin-plug on the bottom and a horizontal
screw mounting bracket on top.
Thanks.

The 12A6 is a tetrode, the 6V6 is a pentode. Having said that, the base is the same, except for the additional grid, of course. Kind of like the 807 vs. the 1625 (except pinout different on those..) Might work???

Are these the ones with a Motorola 145106 based PLL synthesizer on
it's own board? I have a couple of them (not that I want to get rid of
them). What are your plans for them?

I just looked the 6V6 and the 12A6 up, and they are BOTH
beam power PENTODES!

Hence the suffix "6". The suffix means that each has 6 elements.

1 - plate
3 - grids
1 - cathode
1 - filament
---
6 total elements.

Check out the NJ7P tube database at:

http://hereford.ampr.org/cgi-bin/tube?tube=6v6

and

http://hereford.ampr.org/cgi-bin/tube?tube=12a6

I have an original model of Conn Stroboconn musical instrument tuner, one of whose chassis (it comes in two small suitcase sized boxes!) has two metal 6V6s. Every tube in that chassis has a hold-down type socket, and only the 5Y3 rectifier is glass.
Conn must have been trying to ruggedize that chassis.

Oddly, the other unit has 4 6V6s in PP parallel (to drive the synchronous motor in the other unit), but they're all glass GT.

If I lived next door to you, I'd trade you the two metal 6V6 for two glass ones -- I like to see my tubes light up! 73, Mike K. AA1UK

I don't have my Handbook handy, but might one be a true pentode, and the other
a beam-power tube like the 'L6?

The beam-forming electrodes substitute for the suppressor grid, and ISTR they
are likewise connected to ground. 73, Mike K.

Bruce posted in part:
<< I would like to get some opinions from you about the capabilites of the TMC GPR-90 receiver. >>

Many years ago I worked someplace where I had my own SX100, and the company's 51J3 or J4, and a GPR90. They were all not more than a year old.

They were all good, but my preference was to use the 51j4 when I needed to find specific frequencies fast, accurately, and I used the GPR90 for everything else. It is a "no compromise" receiver. The SX100 didn't get much use. By the way, the transmitter of choice at the time was a GPT750 - one mighty fine rig. I could switch it's input to my CE10B and drive it to full output on SSB.

Don

Source record: 36489

Nope,

Both are listed as BEAM POWER PENTODEs. Not Pentodes, or tetrodes,
or, ... but beam power pentodes.

Check them out for yourself:

http://hereford.ampr.org/cgi-bin/tube?tube=6v6
http://hereford.ampr.org/cgi-bin/tube?tube=12a6

These are straight from the RCA tube book.

The NJ7P tube database is really quite good.

Interestingly enough, it lists the 12V6 as the preferred substitution
for the 12A6. Howard Sam's sub book lists them as substitutes for each
other, but indicates that they may not work in all circuits. I would
venture that this is because the socket base is slightly different.

The 6V6 is a 7AC, and the 12A6 is a 7S. They appear to be pinned
the same, except the 6V6 has pin 1 as a shield, the 12A6 has pin 1
as a NC.

My recollection, for what it is worth, is the 12A6 is a ruggedized
version, of the metal 12v6, made for use in tanks and airplanes.

I first came across the 12A6 in the Navy/Collins TCS transmitters
and receivers. The 12A6 was used as the vfo, and the audio
output stage. I later found them in a Heathkit monoblock, as the
PP output stage.

The metal versions of the tubes use pin 1 as the metal ground return.
When subbing a metal tube for a glass tube, you have to be very
careful that pin 1 on the socket isn't used for something embarrassing,
such as a high-voltage tie point.. That could make life very interesting.
A 6V6 is a metal tube unless it has the G, GT, etc. suffix.

Uncle Peter,

I realize that we are talking about metal tubes. That is why the
subject is what it is. ;-)

I thought it interesting that the 12A6, which is metal, is not shown
as having pin 1 as a shield, but rather, as a NC. The 6V6, which is
also metal, does have pin 1 as shield.

Hi Chuck

Looking in the GE tube manual, they show the 6V6, 6V6GT, 12A6,
and 12A6GT all as being 7AC based, with pin 1 being a N/C. I'd
think an ohmmeter test on a metal 12A6 between pin 1 and the
shell might be an interesting experiment.

Not with the intention of being persnicketty, but only because it can be confusing (was to me also!), the "6" for beam power pentodes (some call them beam power tetrodes, and others just beam power tubes) works out like this:

1 - plate
2 - grids (g1 and g2)
1 - cathode + beam plates (internally connected)
1 - heater
1 - shield (pin 1, always the shield in the original octal spec)
---
6 total elements.

Pentodes with all 3 grids brought out separately will end in "7", such as the 6SJ7.

Tubes that were never made with a shield due to lack of enough base pins, such as the dual triode 6SN7 and 6SL7, do not count a shield connection, but other tubes that AFAIK were never made with a shield but did not use all 8 base pins, often -were- numbered as if they had a shield. One example is the 6DQ6 beam power horizontal output tube. However, back up one page in the tube manual and you'll see the 6DQ5 beam power horizontal output tube. Both tubes bring out heater, cathode+BP, 2 grids and plate, but the 6DQ6 is numbered as though it had a shield while the 6DQ5 is not. I get the impression they just stopped pretending about the shield sometime in the late '50s. Miniature tubes didn't do the phantom shield thing, so the miniature tube version of an octal tube type will typically have an element count 1 less than the octal. Examples are 6J5 vs. 6C4 (triodes), 6V6 vs. 6AQ5 (beam power tube), 6SJ7 vs. 6AU6 (RF pentode).

> lousy on ssb. Perhaps the GPR is different.

That would be the venerable MSR-1 (CV-591) or MSR-4 (CV-591A) sideband adapters made for the military by none the less then TMC.... the same company that made the GPR-90. They were used with R-390, R-390A as well as GPR-90 receivers.

A properly aligned R-390A (or GPR-90) along with a properly aligned CV-591A make SSB sound like a thing of beauty. Not to mention the QRM fighting ability of use in AM (selectable sidebands for reception) and CW. I have heard those who say that the CV's were not very effective on SSB. These guys have obviously never heard a properly tined example.

It is time for one last shelf-cleaning session for this year, so that I'll have room for something new in 2003. Prices for all items below do not include shipping from Seattle, 98144, which will be paid by the buyer.

1. Allied AX-190 Receiver - A nice, solid state, ham-band-only receiver with a 15 mhz WWV band and a spare crystal position for your own band addition. This one is working fine, and has good cosmetics excepting for some scratches on the case top. A light overspray of the case would make it a very good looking rig. It has one of the nicest and smoothest weighted tuning dials I've used. See it pictured at:
http://home.earthlink.net/~ab7yd/misc/ax190.jpg

Price with a commercial manual copy is: $85

2. Central Electronics Slicer Model B - The CE Sideband Slicer is a phasing-type sideband adapter for receivers with a 455kc IF. It provides a sharp cutoff at the carrier frequency and very good opposite sideband suppression. This one is working and is in very nice cosmetic condition. See it pictured at: http://home.earthlink.net/~ab7yd/misc/CESBSlicer.JPG

Price is $45

3. Hammarlund Noise Blanker Accessory -- The Hammarlund NB is a true IF-type noise blanker designed for the HQ-170 or 180 receiver. This one is working and is complete except for the dual-concentric pot that replaces the original Noise Limiter control on the receiver. (I have used it with the pictured mini-pot mounted in the headphone jack front panel hole) It comes with a copy of the factory manual covering installation, use, and alignment. See it pictured at:
http://home.earthlink.net/~ab7yd/misc/HQNb.JPG

Price is: $35

4. Swan NB500 Accessory - This Swan noise blanker is untested but is complete and in good cosmetic condition. I can provide an electronic copy of the schematic which I found on the internet. See it pictured at:
http://home.earthlink.net/~ab7yd/misc/SwanNB.jpg

Price is $25.

4. Central Electronics Model DQ Q-Multiplier. This CE Q-multiplier is untested, but is complete and looks good. It is the same basic item that is added to the famous CD Sideband Slicer to make it a "B" model. See it pictured at:

http://home.earthlink.net/~ab7yd/misc/CEmodelDQ.JPG

Price is $25

Hi Michael,
As mentioned before I have been toying with a similar idea.
Tonight I pulled out my old Galaxy V 5.0-5.5 Mc VFO and decided to do
some tweaking to see just how low it might go.
By adjusting the coil slug only I was able to move down about 275 kc.
So I started adding more capacitance across the tuning cap. At around
270pf I got it down to 3500, with a tuning range of almost exactly 3500
to 3600.
If you know the Galaxy VFO, it has a very silky tuning and the dial tics
are in linear 5 kc steps. I think with a bit of tweaking I can get them
to be exactly 1kc tics and relatively linear across the dial. Boy, the
feel of the tuning is great in this range.
Moving this particular VFO up to 7 Mcs would result in touchier tuning
than the original 5kc tics but I wouldn't suspect it would be so touchy
as to be prohibitive. If I can unstick the coil slug :-(I might give
it a try just to see.
There is also a bandpass xfmr in the circuit. It still peaks well at
this frequency range without modification. Actually the VFO has more
output than at the original frequency, 5.5v p-p vs. 3.5v p-p according

to my crude measurements.
My intended use is with a Harvey Wells Bandmaster which prefers a 3.5 fundamental right thru 15 meters and of course my main interest is the CW frequencies. I suppose if I wanted to try 80 AM I could switch in a different cap or something.
So, the idea of modifying yours might have similar merit. This mod should work out great in my situation.

Working on that 160 meter 'no resistor' dummy load, huh Dave. $126 will get you 500 feet at Mouser - OUCH!
I bought a 100' roll years ago for various little projects and most of it is still with me.
Might I ask, what's the plan?

Run along next to a siding board on an apartment, go down to the ground
and be buried, run out to the fence and connect to an antenna. Only
has to handle about 15 watts so it should be OK at 3-7 MC.

Well, I suppose it would work if the distance is really not as far as it sounds (couple hundred feet?). One of the bigger gripes about 174 is the connectorization. You can put a phono plug on it or something like that and use an adapter but the stuff really doesn't like to be handled afterwards.
And the jacket for burial use? Dunno about that.
I don't know if this is your place or a rented place but in my CATV work I've found a big one-inch piece of conduit is often visually acceptable where ANY piece of wire is not. I guess the conduit looks 'official'.
If it were me, I'd look for another alternative than 174 if at all possible.

Bad idea. If someone has screwed with the wiring then you certainly
can't trust the wire colors. Regardless, I don't think there was a
recorded chart for the wire colors in the transceiver, at least I
haven't seen one. The best thing you can do is disconnect all the
wires from the jones plug, find the component at the other end,
disconnect the wire from the connection and test it. It's a long, slow
process, but much better than hit-or-miss with color codes that may or
may not be correct. And when it's finished you will have the
confidence of knowing for sure that it's wired correctly.

BTW, if you are going to rewire the jones plug, you might also add
some chokes and caps like those that were added to the later radios.

Also, replace that C202 can as soon as possible. Mine was bad, and
after talking to a few other people that cap seems to be a source of
problems as the radio gets older.

Thanks for the reply..tryed that..smoked a 10k resistor following the diagram..whatever he did, it's throughly messed up. Nothing is where it's supposed to be. Some funky mods in the audio section. He even rewired the Jones plug to the power supply for some reason. Got that working but no go with the rig. I don't know what he was trying to do but it will have to have a Swan tech to do it (if you can find one..) Cost more to fix in money and heartburn than it's worth. Want to mess up a perfectly fine radio, let a ham do some mods to it..Torks me..Landfill time...tired of messing with it..Thanks for the response..

4200. HELP..YAESU MIC QUERY

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-12-01 14:07:26 UTC
From: robco@optonline.net
Message-ID: <alfkuugs0h2d9q4ftvthpnj7p5krg6hfei@4ax.com>
Source record: 36423

I am still trying to find a desk mic for my FT-900 without purchasing the pricey Yaesu MD 100a8x.....I believe the 100a8x is a dynamic mike, and I would like to use my Kenwood MC-50, or MC-60 which I believe are also dynamic mics....of course one has a four pin connector, and the other an eight pin connector,and the FT-900 has a RJ-45mic connector, but I could make an adapter for the 4 pin connector on the MC-50, and an 8 pin adapter is available....my question is since I have no desire for the up down functions, and merely want the mic to function as a basic audio in/PTT devise, what is the 5volt I see in the diagram of the mic connection...what is its purpose....can I just use the MC-50/60 barebones as I propose????
Many Thanks to any and all who can offer advise....Bob....If you reply directly, please just click on robco@optonline.net

I have a lafayette HA-1200 2 meter radio that has no power cord. The power connector on the back of the radio uses a Cinch Jones 12 pin connector. What I would like to know is what pins in the connector is utlized for A/C operation?

Thanks

Joseph

This is tube related- honest.

Imagine this: A sealed glass jar-
about the size of a mayonesse jar.
Connected via a glass pipe tube to a 55 gallon drum of water
which is air-tight.
You open the bottom hole in the drum and start draining the water.
How good a vacuum could you pull in the glass jar?

4207. Re: Strange Tube Question

No higher than the vapor pressure of the water at whatever the ambient
temperature is, assuming that the 55 gallon drum doesn't crush first. :)

(see the "VFO Question" thread for previous details)
I did some more experimenting with the Galaxy VFO to see about moving it up to 7 MHz. Without hacking up the coil it simply will not move that far just with alignment. Seems like it would be easy enough to do...the coil is easily accessible.
Now here's something strange. Last night I was using ceramic discs to get an idea of the appropriate value to move it down to 3.5. I found that somewhere around 270-300 pf gave me the desired tuning range. So today I figured it was time to install a good silver mica cap, button it all up and see how it tweaked out.
It goes nuts with garbage all across the band when a silver mica is used! I went back and forth and tried various combinations but the only time I get a clean signal is with a ceramic disc cap. The existing circuit uses a 50pf air variable as the main tuning + 120pf SM padder + 15pf air trimmer + 20pf TC cap and a 3pf air trimmer for the front panel Cal Adjust. My 270pf is of course in parallel with all of this. Can someone explain why it behaves this way?
Maybe an option is to use an NP0 ceramic but I'll have to order some to try.

For Sale: Hallicrafters S-107 receiver. Covers .550 to 31 Mc. and 48 to 54 Mc. Decent condition altho some of the lettering on the chrome strip on the front panel is worn off. Powers up and receives signals but it can use some TLC, probably some new caps and an alignment. All original, no mods that I can see. It's the Mark 1 model. Pictures available on request. $55 shipped to US addresses.

Email for more info...

I'd suspect the oscillator is breaking into parasitic oscillations, short
of
having a spectrum analyzer, a good wideband scope should give some
indication of what is going on. The difference between multiple caps
and a single component is the overall change in lead inductances, it's
not necessarily bad to use to multiple caps in parallel to reach the
needed capacitance. You might find a single NPO ceramic disc
exhibits the same problems in that circuit. One trick you could try is
a 68 to 120 ohm resistor in series with the control grid or plate, that
should help with the parasitics if they are the cause of the problem.

Also, a disc cap with a slight negative co-efficient might lead to better
frequency stability with warmup. Something else you need to play with.

Pete

Bill:
What Pete said. You might also try a ferrite bead at the control
grid of the osc. tube, or even on the "hot" leg of the
cap you're installing.

Yes, it definitely shows on the scope. That confirms what I hear on the
receiver :-)

The difference between multiple caps
> and a single component is the overall change in lead inductances, it's
> not necessarily bad to use to multiple caps in parallel to reach the
> needed capacitance.

Thats not the problem in this case. My 'working' combo is a 270 pf disc
in parallel with a 22pf SM. 270pf or 300pf SM give the nutty operation
as do any combo of SMs.

> One trick you could try is
> a 68 to 120 ohm resistor in series with the control grid or plate, that
> should help with the parasitics if they are the cause of the problem.

Ok, I'll try that and see if I can also find a ferrite bead later this
evening.

BTW, here's the schematic....

Hi,
I own a 65' boat that resembles a PT boat during WWII. I want to build a 14' X 25' salon topside but want to know if marine construction of walls and ceilings differs from that of home building. I would use glassed marine plywood for the exterior, or a composite, but do not know what is the best material for the framing. Also, what methods are used for marine joinery of the frame and roof sections(screws, nails, special joints?). Any help would be
appreciated on design, and any books or links that would be helpful. I really want to screw it up....ah, hmmm...build it myself.

Thanks

In case this post is/was truly legit, I'll help here. This group isn't about
'BOATS'.......it is about 'boatanchors' which is a word/term in reference to
old tube radios .And this group is about trading/swapping/ repair of 'old
radios'.

Hope this helps out. :-)

Ok, here's my fix. There was no easy way to fit in a resistor or bead because the grid pin of the tube socket is the tie point for a wad of components and its vey inaccessible. It was a series-tuned Colpitts (Clapp?) circuit and I switched it around to be parallel tuned. Voila. Clean as a whistle. A little less tuning range - about 65 kc which is fine for me. However that shoots the nice dial calibration idea I had. With the parallel scheme I can't stretch 100 kc out of it however I'm thinking of going back in and see if I can squeeze it down to 50kc. That would make the existing dial markings line up.
Next problem...I calibrated the scope and darnit the main output I was getting was showing up at 5250 and not 3500. Further checking reveals 1750 was there also. I wonder if the original 5 MHz circuit was actually running at 2.5 and doubling? No GDO to check with.
Anyway, not to worry. I put 220 pf across each side of the bandpass xfmr and it now picks out the 3.5 signal quite cleanly.
Final test will be to see if the 2.5 v RF that I have left will be enough to drive the old Harvey Wells.
Drift? Solid as a rock.

-BM

Hi Randy
The Ranger 1 had only the line mounted fuse plug ... I don't know about the ranger 2. They never changed the production even though the plug could be lethal. I just love my Ranger 1 and have converted all the power supplies to solid state and changed the audio so that I don't sound like somebody has a grip on my throat or worse ....other parts while I am talking. There is a set of mods by a W1 on AC6V that I did. I have just acquired a mint Johnson Invader 2000 a few weeks ago. Unbelievable to find one here in NZ

Hey guys,
It was truly a mis-posting as I thought I was still on "rec.boats.building".
But while I am here, does anyone know where I can find a manual for an old
Motorola T1099b frequency meter? I have tried a few sites but no luck.

Thanks

Jules:

The T-1099 is actually a Deviation Meter, which is just a bit different than a plain frequency meter. The meters may have been made for Motorola by Marconi. Here's a copy of the only reference I could find on this equipment; it's old, but at least somebody had copies 5 years ago! <g>

E. F. Johnson Thunderbolt linear amplifier in very good
condition.

Inside is immaculate, clean shiny almost like new.
Has full output from a good pair of 4-400A tubes.
Outside is extra nice with a couple of minor scratches that
will clean up easily. Otherwise immaculate.
Inside looks almost like new above and below deck.
This amp sparkles. Front panel has one small sticker that
can easily remove.
Needs 220V AC and comes w/good power cord. Also has original accessory
cord
with special connector.

$895.00 plus insured shipping
Includes heavy duty packaging w/woodbase.

E-mail me for pictures or to arrange purchase

FOR SALE:

Collins MM-1 microphone, winged emblem. Great shape.

Ideal match for the Collins S-line, and KWM-2A etc., but will work nicely with other Collins gear.

"Designed to fit your hand comfortably. Engineered for max voice response, die- cast case finished in brushed satin chrome. A five-foot length of Koiled Kord with mike plug is supplied."

The MM-1 has a frequency response from 200-10,000 cycles per second and has an output level of -48 db.

Excellent condition with the original Collins style 0.206" plug.

Now reduced to just $115.00 plus shipping

E-mail me to arrange purchase.

Hi,

Check out these two articles. "Souping up the Super Pro", December, 1957 CQ
and "Save your Super Pro for SSB", September, 1958, CQ.

I made these modifications and it makes the Super Pro an excellent radio!
I did all the mods in the Dec. 1957 article, not wanting to change over to
the
miniature tubes used in the Sep. 1958 article. I did the product detector
mod in the Sep. 1958 article, using a 6SA7 instead of the 6BE6 miniature
tube. It works very well!! Most surprising to hear an old radio like this
work so well
on SSB!

I have two of them. Nice audio for listening to SW AM broadcasts (this is largely a function of the quality of the speaker), good for ham use up to 20 metres. Sensitivity falls off a bit after that. Quite stable. Good dial accuracy, even after forty-five years on the road. Beautifully built, I would say as good as the Collins 75A series. Cheers es 73. Harry, VE3GRO

Cross-posted to: rec.antiques.radio+phono,rec.radio.amateur.boatanchors

(crossposted to r.r.a.b. for general interest)

(On the Art/Science of radio restoration).

In many cases, the quality of craftsmanship used to construct the
radio in the first place is one of the major reasons to preserve it.
Replacing any component disturbs that original craftsmanship.
No matter how talented a restorer may be,
the radio will never again be "original."
But, like most people, I can't stand to let
a wonderful old radio sit like an embalmed mummy.
Is there a middle ground between "shotgunning" the set
and leaving it as a dead "display only?"

Yes; we can get creative. I wrote here some time ago about
the success I have had using much reduced B+ and augmented audio.
I replace only those few components that absolutely *must* be replaced,
like a dead-short screen bypass
or a 2 meg grid leak that measures 10 meg.
In those cases, I clip loose one end of the part,
tuck it out of the way and tack in a replacement.
In places where a resistor has gone "high"
and it's hard to reach without disturbing the
original wiring, I find a place to tack another resistor
in parallel to the "high" one,
which moves the value back down to spec.

I have successfully run many WWII military radios and a couple of
consumer sets, designed for 250 Volts B+,
at 24 volts B+ and an external amplified speaker.
They sound great and the internal craftsmanship is preserved.
As soon as the radio plays well without things heating up,
I'm done. Because of some good advice from a kind member of
this group, I do look very closely at the grid coupling cap
on the audio output. But unless it's so bad it causes
distortion or tube damage (unlikely at the low B+), it stays.
Little amplified speakers are cheap as dirt these days.
Or, you could rectify a little filament voltage and run
the amp internally, saving wear and tear on your irreplaceable
audio output transformer.
Audio amp modules that deliver plenty of volume
could sit on the end of your thumb these days.

This has three immediate benefits:
1. The radio plays with minimum work and

minimum departure from "original."
2. The heat output from all stages is vastly reduced,
which helps preserve the original components.
3. The stages are more stable, since there's little
heat related drift.

Most important- at least to me- the radio is better preserve
for future collectors/historians.
After all, we don't really "own" our collections.
We're just the temporary caretakers of them.
What matters is the quality of our stewardship.

Kind Regards,
David S.

David,

Different folks, different strokes.

Tacking new parts on old parts, and clipping leads, and
tucking them away just makes it look like an incredibly
untalented hack has worked on the radio.

Running tubes at drastically reduced B+ voltage causes
the tubes cathodes to go nutty with what Tektronix called
"cathode interface", a condition where the cathode develops
a resistive layer (interface) between the cathode electrode,
and the barium oxide emitter coating. It is a permenant
condition that requires the replacement of the tube. The
set can never be original if you replace any tubes, can it? ;-)

Audio output transformers are designed to operate at the
loads they normally encounter. They are destroyed when
coupling capacitors short and cause heavy currents to
flow thru the windings. Fix the coupling capacitors,
and the transformers will last forever.

There are very few sets out there that haven't been serviced
in their lifetimes. It really doesn't change the historical
accuracy of a set that was made in 1940 and serviced
thru 1960, to be serviced again in 2002.

If you feel that strongly about preserving the past, you
will have to never touch the artifact. You will have to store
it away in perpetuity in a dry climate controlled cave
somewhere. Even the Smithsonian restores their artifacts.

As I said, different strokes...

That's a matter of opinion. I think it shows
a respect for the original work.

> Running tubes at drastically reduced B+ voltage causes
> the tubes cathodes to go nutty with what Tektronix called
> "cathode interface",
Far be it from me to argue with Tektronix.
I'll tell my tube lineup that has
run this way almost daily for going on three years
that they're supposed to be bad.

> Audio output transformers are designed to operate at the
> loads they normally encounter.
> Fix the coupling capacitors,
> and the transformers will last forever.
No, they die when the current through them creates enough
heat to damage them, regardless of their designed loads.
You can hook a voltage source directly shorted across that hair-thin
primary if the current is low enough to prevent damage.

I didn't say you could do this willy-nilly.
You obviously must look for stages that are drawing heavy current
due to very bad components. But this isn't black-n-white.
A cap that leaks 25 MA at 250 volts might leak 5 microamps
at 24 volts, doing no damage whatsoever.
Each case must be treated individually.

> There are very few sets out there that haven't been serviced
> in their lifetimes.
That may be so in consumer sets- I admit that's not my first
area of expertise. But it is unusual in the sets I collect.
Several of them were produced in quantities of less then 1000.
Some of my sets were made in quantities of less then 50.
Anyone could get them playing by hacking them up.
The challenge is getting them to play without hacking them up.

> If you feel that strongly about preserving the past, you
> will have to never touch the artifact.
>... Even the Smithsonian restores their artifacts.

As you say, even the Smithsonian restores their artifacts.
And I do know guys who don't touch their radios; they're displays only.
I want to make mine functional while maintaining their integrity
and this compromise has worked well so far.

I would like to complete my R-45/ARR-7 set-up so need the following:

Power Unit PP-32/AR
Mounting base MT-171/U
Mounting base MT-167/U

lead; RX to PSU
lead; ac supply PSU
chassis mounted plug for rx, 6 pin

If anyone can help with these items I'd be most obliged.

cheers, Ben G4BXD.

I suggest that you learn to read..

1. If shunts were included, they would be listed... No shunts listed = no shunts included.

2. Field strength is listed for each meter..

>No matter how talented a restorer may be,
>the radio will never again be "original."

I will never understand why an old radio has to be that original.if a tube goes out ,you replace it with whatever brand is available,if a speaker goes out you replace it with a universal replacement that fits,nobody ever knows about it ..same with caps, you replace them with something will last till end of time..What if car collectors tried to follow that scheme ,no new paint all original equipment parts,original tires,original uphostelry, battery etc.. ...BULL,Bull, bull ...If it looks new and works good ,thats good enough for me ...Harold

In my own opinion, radio restoration should be akin
to building restoration - it's the architecture
that counts, not the materials. As long as the
tube lineup remains, or a facsimile thereof,
there shouldn't be anything wrong with replacing
the small components. The essence of the piece
is what it does with what it has to work with.
The Leaning Tower of Pisa remains a classic of
rococo design, never mind that it has 20th
Century steel beams inside it.

> How good a vacuum could you pull in the glass jar?

Disregarding the vapor pressure issue in the other response and using a barrel height of three feet, you'd get a vac of about 2.64 in-hg, not very good. Three feet of water equates to about 1.3 psi.

30 in-hg = 33.99 ft of water = 14.73 psi

This radio has sitting in a box for years and needs a home.

Radio is fully functional. The only modification was to change the 3 pin mike connector to a 4 pin type. I still have the original connectors if you are into restoring radios back to their original state.

See: http://www.rigpix.com/icom/ic20.htm for picture and specifications.

Includes the following crystals:
Position Rx Tx
1 147.000 146.400
2 147.060 146.460
3 146.940 146.940
4 145.010 145.010
5 146.940 146.340
6 146.910 146.310
7 146.760 146.760
8 146.760 146.160
9 146.520 146.520
10 146.580 146.580
11 no xtal
12 147.180 147.780

Original ICOM manual included. Shipping is extra.

Regardless of the definition of "spam", the defusion works.

Congrats, too, for deciphering. ;-)

Now, for you (but you already know) and everyone else out there,
the base (bottom) side of the (*)0BVL coil looks kinda like...

```
---------------------------------
o o o o
---------------------------------
(bottom side)

Coil 1 SL~ Coil 2
_____________________
(*)0BVL
---------------------------------
|| || || ||
|| || || ||
(Side view)
```

(* = 8, as in 80 or 40, or 20....)
(~ = Swingling Link - Link is -not- attached to the coil)

Hi,
I have two HF kilowatt range sources. I opened up one and it had a 8877 in the socket. The units were used near 30 mhz as a high power RF source to generate a plasma. The load was a coil that was kept tuned by the auto-tuner. They have a lot of goood tunning capacitors , chokes , coils, meters, tubes and sockets,some solid state, etc..... or could be modified to work as is. They are rugged.

I am looking for a small ssb linear amp.

Not a real wonderful one, because now you have a jar full of water vapor.
The water boils off into the vacuum.

It works a lot better if you use mercury, but you still wind up with residual
mercury vapor and a little air, which you need a diffusion pump to remove.
I think it is possible to get less than 2 torr without a diffusion pump
but most displacement-type pumps using oil or mercury are in the 100 torr
range.

4304. WANTED: Raytheon / Apelco / Webster

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-12-04 22:04:09 UTC
From: k5dh@raytheon.com
Message-ID: <tZuH9.123$Z74.849@dfw-service2.ext.raytheon.com>
Source record: 36277
Cross-posted to: rec.radio.swap,rec.radio.cb,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

As always, I am looking for 1960s and early 1970s
CB radio equipment from Raytheon, Apelco, and
Webster to fill holes in my museum collection.
Here is a list of specific models that I need to
complete the collection:

RAYTHEON:
Tube-type: Raycom
Solid-state: Raycom III, Raycom IV (AM/SSB),
Ray-Tel TWR-11, Ray-Tel TWR-11T
Handheld: Regal Ray-Ette, Super Ray-Ette, MW-2

APELCO:
Solid-state: AR-15, AR-16, 565

WEBSTER:
Solid-state: Bandspanner 550

ALLSTATE (sold by Sears):
Tube-type: 832.62270

AIRLINE (sold by Montgomery Ward)
Tube-type: GAS-587

I would be interested in hearing about any Raytheon,
Apelco, or Webster CB gear that you might have, even
if it's a duplicate (I'm always looking to upgrade
models that I already have). I'm interested in any
"parts rigs" that might be collecting dust also.

In addition to the radios themselves, I am seeking
any kind of related printed matter, including dealer
sales literature, owner's manuals, service manuals,
magazine ads, magazine articles, and so forth.

If you are a vintage CB collector and have any models
in your collection that I need a photo of, I'd like
to work with you on that.

If you ever had any involvement with CB gear from my
target brands, whether it was sales, service, worked
for that branch of the company, or whatever, I'd love
to hear from you as well.

If you have any interest in vintage CB, please visit
the Raytheon/Apelco/Webster CB Radio On-Line Museum:

http://www.qsl.net/k5dh/raytheon.html

DISCLAIMER:
For those hams who are offended that I placed an ad for CB equipment on ham radio newsgroups, I need to point out that the overwhelming majority of radios, printed matter, and historical information that I've collected so far has come from hams, not from CBers! Perhaps that's because so many of today's hams were CBers "back then".

Thanks and 73,
Dean K5DH

I'm wondering if this face may be a special military or
radioactive-dial model. I have both a '41 Chelsea & a same-period
Sestrel (English, chromed, better glass), and neither look anything
like this. Also, it is interesting that the marine silent periods
later changed to 15 min later - does anyone know specifically when?
One old R/O had penned the new periods onto the face with a marker. I
also have an 8" Chelsea engineroom clock of the same period
(swing-open, not the "watertight" & very inconvenient screw-on).

Ship's Radio Room clocks with the silent periods at 15/18 and 45/48
past each hour were used for the radiotelegraph watch on 500KHz.

Ship's Radio room clocks with the silent periods at 00/03 and 30/33
past each hour were used for the Radiotelephone watch on 2182KHz.

Some clocks had markings for both services, some didn't.
It depended upon the tonnage of the ship in which the clock was
originally installed.

All ocean going ships over 1600 GRT had to keep a watch on 500KHz.

Smaller vessels were allowed to keep watch only on 2182KHz.

This system endured until 1999 when it was replaced by the GMDSS.

Regards,
Doug/WA1TUT

(Ship's Radio Officer from 1978 to 1998)

For those that would like to see what a brass Kelvin Hughes radio room clock looks like see

http://www.zip.com.au/~sb/anars/w_radio.htm

This clock has both the 500 and 2182 khz sectors (the former red and the latter green) plus the red sectors round the dial for the automatic alarm.

These clocks seem to be fairly scarce but mine was picked up with another as a pair for a reasonable price at a local weekly house type clearance auction. Despite their scarcity, the price could well be lower than than for a similar plain clock as potential buyers may consider them "defaced". Incidently these clocks often come with a 5 - 6 day spring which could confuse people as to being a faulty 8-day movement. They were intended to be wound daily and used the top end of the spring tension to maintain maximum accuracy, the remaining days allowing for someone forgetting to wind it for a day or so.

Radio books for sale.

Single books $2 media mail or actual costs shipping in the U.S.
Multiple books at cost.
All books good, clean condition unless otherwise noted.

Heathkit Manuals

Original Heathkit HW-16 Specifications handout from 1968,
the fold-out single page the sales folks sent you.
One faint coffee ring. $5

HP-13 Transistorized DC Power Supply. $5

SG-8 Signal Generator. Spine worn, bench worn. $9

HW-16 Transceiver. Complete but bench worn. $10

HD-20 Crystal Calibrator. Fine condition. $4

HA-201 2 Meter Amplifier. $5

HG-10B Amateur VFO. $9

Military Books

Handbook of Maintenance Instructions.
Radio Receiver R-64/ARW-17 March 1945, $5

WWII Bendix TA-12 Aircraft Transmitter manual.
Good quality bond photocopy. $10

TM 11-630 SCR-506A. Original. Some wrinkling on the last quarter
of the pages from moisture. Some rough pages. $9

TM 11-5820 Radio Sets VRC-53, -64, GRC-125, GRC-160.
Missing cover, otherwise good shape. $5

Surplus Radio Conversion Manual Volume #1, 1948.
Dog-eared corner on the cover. Professional rebind. $9

Surplus Radio Conversion Manual Volume #2, 1948.
Good condition. $9

TM 11-487A Directory of Signal Corps Equipments,
Radio Communication Equipment, Aug. 1950.

Fair photocopy, well bound. 255 pages. $8

NAVSHIPS 900,707 RAX-1 Receiver manual.
Big, good photocopy. Bound, but they didn't bind
the foldouts correctly, so you might want to redo it. $10.

Tube, Transistor and Picture Tube Books.

CBS "Technician's Handbook," 1st edition, 1st printing, 1957,
characteristics of vacuum tubes,
semiconductors and Picture Tubes, pages not counted but about
an inch thick. Lots of very neat information. Ring bound. $10

General Electric "Essential Characteristics" 1969 edition, 370 pages,
containing essential data on tubes, picture tubes, semiconductors
and photocells. $10.

RCA Technical Manual PT-60, "Phototubes and Photocells," 1963,
192 pages. $5

General Electric "Transistor Manual," First Edition, undated but
believed to be around 1958, 61 pages. $9

General Electric "Transistor Manual," Second Edition, undated but
believe to be around 1960, 112 pages, $9

"Transistor Specifications and Substitution Handbook," TechPress 1964,
96 pages. $4

Test Equipment and Misc.

Sams Photofact Publication
"Radio and TV Alignment Handbook," 1st Edition, 1961, 158 pages,
excellent reference for the antique TV collector. $5

RCA type WA-44C Signal Generator manual $4

Gernsback Library #49, "Radio and TV Test Instruments,"
1953, 128 pages, Good condition $5

This clock & its face looks very much like my Sestrel (English), which was originally installed aboard a Norwegian-built tanker (which was subsequently converted into an acid tanker, and later converted by myself into an interim chemical tanker, now scraped). However, the Sestrel's face lacked the green periods, which got marked-on by Sparks, and later removed by me. The Sestrel also has much thicker glass than Chelseas do, which is beveled & extends beyond the bezel. I can't tell from the photo if this is the case with the Kelvin Hughes.

For some years, I thought of replacing the radio face with a normal one, since both were still available new for about 2 pounds up into the mid-'80's. I think I'll leave it the way it is now.

The unpredictable vagarities of the tanker market occasionally had us scrapping tonnage, and I always felt such little pieces were better off in my home than in that of a Taiwanese scrapyard owner. :-)

I'm surprised to hear of the daily winding routine, as the rest of vessel clocks were wound & set weekly (noontime Sunday in our fleets), and my radio room clocks respond just as accurately to the same routine when adjusted for it. But what do I know? Before my Owners Rep days, I'd been trained as a Cheif Engineer, not a R/O. And most of us didn't visit the R/O's because, well, they were wierd<hee-hee>.

AHH, what you need, is my never-used, never-installed and still-new
1972 Raytheon DE-732 (I think) depth sounder, complete with unused
original transom-mount transducer & cable - the original and popular
neon flasher in the round case.

No, but I went thru the Vega factory in the mid 50's - it was in an
old farmhouse in the middle of a peach orchard in what is now the
heart of Silicon Valley. The Cupertino HP plant is located there
now. My, how things change...

Why do you want to build a regen? They are pretty lousy radios and
that's why people quit making them commercially. Most people who build
them are doing so because they are too dumb to align a superhet or too
cheap to buy some sort of signal generator.

I've built superhets, direct conversion, and regen receivers and I don't feel dumb. where did you obtain your incredible insight?

For one thing, building a GOOD regen is fun. Especially with a preselector ahead of it. And name one receiver design with more sensitivity than a regen.

Mostly, it's fun. I find my signal generators for all types of designs.

I have not tried a compactron, but it looks good. My first regen was in about 1950 and it used a 1D8.

Antone, you have a lot to learn. Work harder at it.

Don

And when the newspaper become 90% ads, will you still buy it?
Probably not if you are interested in the news and sports. Same
for the newsgroups, they are to discuss the subject the group was
created for, not a place for ebayers to continually post their
ads. I wish it were an Usenet rule that when someone signs up with
ebay as a seller, they are automatically blocked from access to
Usenet newsgroups.

>cheap to buy some sort of signal generator.

Nonsense! People build them because they're quick, simple, and a lot of fun. If you don't like them, you don't have to build any.

btw, I've designed and built several complete ham stations since being licensed in 1967. Including some fairly complex 100W multiband HF transceivers. And I still find regens to be fun.

I built one last year and it was FUN. Plus it works great. Made
several cw contacts. Also great for listening to both SW AM
and ssb. Sounds much better than most transceivers on ssb
but selectivity ain't too good.

I recently built a 2-tube Doerle using #30 tubes. It too was fun. And one of my recent restoration projects was a 1933 Seibt Roland 23L regen set with 3 tubes. It was fun too and it'll whip the pants off of any 3-tube superhet and many 5-tubers.

Hello, all.

I recently picked up an old Swan 350D rig from another HAM. The rig seems to function, but it needs to be cleaned up quite a bit, and I have no manual for it.

If anyone has a copy of the manual for this rig, including alignment procedures, tune-up procedures, etc, I'd greatly appreciate it.

This is my first tube rig, and I'd like to not blow it up before I get a chance to really use it.

My email address on the newsgroups is fake. My real email address is on QRZ. Thanks in advance.

I'll assume this mail was sent as a troll message.
Just in case it wasn't - I am an inveterate builder- from water cooled microwave amplifiers for EME to state of the art surface mount HF receivers (http://www.parelectronics.com/pics/old/Pg150.jpg) Building the regen is my way of reacquainting myself with the building I did as a kid.
It is now finished- is a real performer and a lot of fun to use.
I will supply a JPEG to anyone that would like to see the finished RX- although the inlaid wood cabinet is still under construction.
BTW, My signal generator is an Adret 730A- about $4600. I'll supply a pix of that too. Along
with the HP 8711B network analyzer.
73,

Dale W4OP

If you can't find the specific manual for this rig, the book "W1FB's Help
for New Hams" has some generic information for tuning up old tube type rigs.

That is why "some" subscribe to two or more papers, magazines, etc, to get
maximum benefit. Maybe that doesn't make sense to some, but to those who do
it, it does. What I dislike more than FS or FA ads in here is the name
calling. Can't people "debate" without getting ignorant? THAT takes away
from it all.
I go into a newsgroup - CB for example, and scanners used to be the same,
and see more posts with name calling than legitimate conversation or debate.
Everyone has an opinion. Share it and move on. No one said everyone has to
agree - nor will it ever happen! Be it ads or discussions, so long as I can
receive the newsgroups, I'll be more than happy to flip through them to read
those I want. One more thing. NOTHING ever stays the same, regardless how
bad you may want it to.....Newsgroups just happens to be a victim......SO,
like it or not, let's all "try" to make the best of it and enjoy what we do
have. Some day it may not be here to even argue about. I post once in a
while, I don't think "I" personally have overloaded the newsgroups with
ads.. Especially not lately. I try to keep mine to a minimum so as not to
have problems.
If anyone feels "I" have over done it, my apologies. I try to reserve mine
for the rec radio swap UNLESS I'm replying to a WTB ad.

Happy Holidays to all.....

Source record: 36332

Hello
I have a FT 920 with the AM filter and FM board. The FT 920 is 100 watts HF + 6 Meters. It has a Auto tunner and the MC 100 Desk Mic. I also Have the 3 KW Roller Inductor Antenna Tuner. They are in good shape I will trade both for a FT 990 or a FT 1000.. I have been using the FT 920 as a backup rig.
If you have a FT 1000D I will add a Henry Radio 2KD-5 Amplifier to the deal. 100 watts in gets you about 1000 watts out. It has new caps and a pair of Emac 3-500. It is wired for Single Phase 240. The same voltage that runs your dryer and electric range. I am will to travel 100 miles from Athens GA. Drop me a email so we can work out the deal.
oris@dirtball.com
Happy Holidays

Hello Bill

I build a two-tube #30 a few years back, and it was fun. The nice thing
about # 30 tubes is you can play with 99s or 01As as well.

I cannot confirm that it was original (before I replaced it), and
although it was of the same relative vintage as the receiver, given the
age of the receiver, it would seem entirely possible that someone else
may have made a changeout.. But, but mine was a 20-20-20 at 400v. I
left the original in there as a dummy and used 3 external caps.

I sold my extremely nice desktop 606A, with manual, a few months ago for $100 after no bites at $150 and then $125. It's just too big for contemporary tastes (and benches) other than fossils like me (and you). And come to think of it, it was too big for me, too.<g> But boy, is it beautifully built.

73, Avery W3AVE in Potomac, Md.

I have for sale a Heathkit SB-221 HF amplifier 80 to 15 meters . The front face is excellent and the cabinet is in good condition no dents and some paint peeling off. Unable to test it out fully, meters light up and fan comes on, but the tube filaments do not light up....Its wired for 110 and meter shows 2800 to 2900 volts. The 3-500Z tubes are Eimac and I do not have a manual for it......I would prefer a pick up and probaly can be an easy fix....I will take $300 and can be reached at (508) 821-2993 or email.....WZ1U Steve Lakeville, Ma.

I'll pretty much agree. Tucker, et al, prices aside (albeit they guarantee and calibrate), in the DC area, the hamfest price for a 606A working, both meters OK and deflect properly, garners $60-$100. A 606B (beige), in A++ condition, a recent calibration sticker (maybe 2-3 years out of date), as above, fully functioning, with a book will bring $150, tops. I have 2 of them and that was the deal. Without the HP cabinet, deduct.. maybe $20-$30? They are nice generators. B+ power supplies are, however, oft times problematic. Regards de K3HVG

Ain't it the truth, Ebenezer! Not to mention that we smell bad, talk
funny and have crooked teeth ;P

And on top of it all, it uses a TUBE -- spare me!

Speaking of the 6AF11 regen, I don't have any experience with it, but
the circuit looks normal, and the completed unit is cute. I imagine
it would be a fine, fun radio with plenty of audio.

Hello folks,

This is a last attempt to find some info on a really obscure piece of equipment. The gear in question is called a "Triple Diversity Receiver" by Marconi, and is believed to have been used by the British Army in the 1950's (??)

It consists of a steel rack which stands over 7 feet tall and contains three CR150 receivers, and a "Common local oscillator" as well as a combining unit.
There are three rack mounted heavy duty PSUs at the bottom of the rack.
Months of searching have provided no info so if anyone knows about this set or where I can get technical data, I would be eternally grateful!
I am also still after circuits for th TMC FRR-60 receiver.

Thanks and 73 to all

Dean, G0JQR

I had one several years ago (15) and had to rebuilt the B+ supply back then. Its an old workhorse and wonderfully built but, unfortunately outdated and not much nostalgic interest. I'd say 100 to 200 dollars depending on condition and the mood of the buyer. de Fred..
PS I think it cost over 3000 dollars back in the 60's when offered by HP.

4377. Value of a like-new RME-69 w/ speaker?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-12-08 01:14:30 UTC
From: "Darren D. Taylor" <kf9z@insightbb.com>
Message-ID: <W1xI9.70660$pN3.5202@sccrnsc03>
Source record: 36200

Hello,

Would anyone know the value of a like-new (honestly) RME-69 SW RX with the matching speaker? It does not have the pre-selector. It looks and works as new. I have tried to get a value by gleaning the web but did not find much that resolved my dilemma.

Thank you in advance,

Darren

I have a very nice, original working Collins 75S-3B R/E with the Fox Tango 250Hz crystal CW filter and stock 2.1kHz mechanical filter for sale/trade. It has no gouges but some scratches that are through the paint on the case but they are small. The front panel is very nice with a couple of spots where the paint has rubbed off (they too, are small). No scratches on the panel and the silk-screen is outstanding. The knobs are very clean and not worn beyond casual use. The meters have a nice white look to them. They are not yellowed nor damaged. The chassis is very clean with no rust or pitting. It comes with an original manual. The trim ring is worn but not abused. There are no modifications that I know of. Nothing stands out as modified. Still has the RCA connectors on the rear and they are in good shape. The date code on the crystal calibrator is 5-71. I am looking for something newer (solid-state) or maybe an older KWM-2/2A in good condition and fully working. I am also open to cash offers. Fell free to make me an offer. I have several high-res pictures available upon request. Feel free to ask questions.

4380. RME-69 value

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-12-08 02:43:10 UTC
From: acomarow@aol.com
Message-ID: <20021207214310.02937.00000251@mb-cq.aol.com>
Source record: 36203

I accidentally deleted your post, but as I recall you wanted the value of this receiver, with speaker, in like-new condition.

The only source I am aware of that tracks the value of ham gear on a regular basis is www.aade.com, which keeps a running record (last updated in early 2001) of ebay sales. That side shows two RME-69's sold, one for $256 and the other for $303. No idea of condition--that information is not included.

In addition, there is the guide, "Shortwave Receivers Past & Present," by Fred Osterman, which lists and describes every communications receiver made between 1942 and 1997, along with a range signifying its current value. He has the RME-69 at $150-$350 and gives its availability as "scarce" (before you get too excited, he reserves "very scarce," "extremely scarce," and "rare" for truly hard-to-find models). It's a wonderful guide. The last edition came out in 1998.

So what would yours be worth in the condition you describe? If it's really like new, obviously it's one of a kind and would command top dollar--from the right person. How many guys are there who would lay out big bucks for this radio? Who knows? If I had to take a wild stab, I'd say you realistically might get between $500 and $1,500. But it's anybody's guess in a situation like this.

Good luck!

73, Avery W3AVE in Potomac, Md.

Source record: 36209

The glass on my pair of clocks extends approx 2 - 3 mm above the brass bezel.

Regarding the winding routine, both my clocks, after a full overhaul by a professional clock restorer, stopped after about 5 days (though they kept much better time and the missing second hands were restored). I raised this problem with the clock department at the British Museum to find whether this was normal or a fault. The curator's response was the daily winding routine that I have described, though it may not apply to other brands or indeed all of those made by Kelvins.

Simon

PS I was never a marine R/O, but am merely a collector of old radios and related material :-)

The winding and care of the Radio Room Clocks was the responsibility
of the R/O not the Mates, although some few Companies who employed
their own R/O's may have had different routines. Personally I wound
mine weekly, unless they obviously had weakened springs. In my time -
long since gone - R/O's rarely sailed on the same ship more than once.
I am referring of course to British and European vessels, the Yanks
did their own thing.

Over 40 some years I sailed with some weird Engineers too...

Best

My newspaper has a classified section, and I often look for bargains in the classifieds......How else would I know if there is something for sale that I might want or need unless someone advertises what they have for sale? And if it upsets you so much, don't click on FA subject lines.

Now then ....

Certain types of individuals have a tendency to try and control everything, what should or shouldn't be listed as an example..... I tend to think that what we have here is a CONTROL FREAK.

Get some help for your aggression , maybe anger management..... I'll just bet that you think no one but yourself is a good and safe driver....

Is my reply in the correct forum? Maybe not, according to some !!!!!

Tech@DP.NET

And when the newspaper become 90% ads, will you still buy it? Probably not if you are interested in the news and sports. Same for the newsgroups, they are to discuss the subject the group was created for, not a place for ebayers to continually post their ads. I wish it were an Usenet rule that when someone signs up with ebay as a seller, they are automatically blocked from access to Usenet newsgroups.

Hi,

Check out these two articles. "Souping up the Super Pro", December,
1957 CQ and "Save your Super Pro for SSB", September, 1958, CQ.

I made these modifications and it makes the Super Pro an excellent
radio! I did all the mods in the Dec. 1957 article, not wanting to change
over to the miniature tubes used in the Sep. 1958 article. I did the
product detector mod in the Sep. 1958 article, using a 6SA7 instead
of the 6BE6 miniature tube. It works very well!! Most surprising to
hear an old radio like this work so well
on SSB!

I guess I can call this a BA :-)
I need a pair of Volts/Div knobs for this rascal. The plastic has
deteriorated and they have crumbled. I suspect similar knobs were on
other HP models. Skirt has 12-positions, 2mv - 10 volts
So since we hams are known to keep all sorts of junque I'm hoping
somebody has a cigar box full of these knobs or a bunch of old HP scopes
thrown out in the shed that might yield these parts.

TIA,
Bill WX4A

Do you realize that the Chelsea Clock Company is still in business?
At least they were about two years ago when I bought parts from them.

I hope they don't mind that you've used their name in a new
product....

Actually I never personally sailed with one with the 2182 Silence
Periods marked. Or kept a continuous watch on 2182 for that matter,
except much later on Coast Stations. USCG or Military perhaps?

Best

Apache Owners and rebuilders:

The following Original Heathkit TX-1 Apache parts are available:

Audio preamp transformers, $5.00
Frequency Indicator Drum and related assembly, $8.00
Driver band switch, $5.00
Final band switch, $9.00
Final loading condenser, $8.00
Final tuning condenser, $9.00
Front panel complete (glass cracked but easily replaced), $17.00
HV plate transformer, $29.00
HV power supply choke, $ 27.00
Meter switch, $3.00
Meter, $ 5.00
Meter mount with pilot light sockets, $2.00
One pair of good 6146A tubes (tested good), $18.00
Various pots, switches and other controls, $2.00 ea
6146 tube sockets, $2.00 ea

Inquire about any minor parts you do not see above.

Shipping additional.

Cheers,

AL

About 1/2 the current draw, and thus less voltage drop between the
amplifier
and the breaker box for starters.

Pete

I strongly suspect your repairman has cut off the weak part of the
original spring which was commonly done by some. When springs in such
clocks are all good, they run slower fully wound, and fast when nearly
unwound, in a linearly-progerrive fashion, so that calibration for
weekly accuracy is pretty good. 8 days is standard runtime for things
that wind & tick at sea, and definitely for all older Chelseas, with
or without bells. I suspect the curator has never wrung salt water
out of his socks or been in the radio room of a commercial ship. :-)

> I am referring of course to British and European vessels,

By the '70's & '80's, the R/O was usually hired as a permanent officer with a vacation relief, both Euro & Yank, unless he got fired<G> or pissed off the crewing agent. But both sort of owners also had many situations that utilized single-voyage hires, whether R/O or any other licensed or unlicensed billet. If you sailed in the '60's, you may have often been in the then-prevailing tramp steamer market, when owners/managers often never knew where, or if, the next voyage would go - and couldn't budget for continuous crews.

> Over 40 some years I sailed with some weird Engineers too...

Are you sure? Seagoing engineers don't become weird like R/O's do - they become twisted. :-)

I managed to rescue these two at a surplus auction, but I unfortunately can't store them for long! They were surplused out by my local state U. and were well cares from from them. One is a rackmount type (RM), and the other is a standard "desktop" model (if you could consider one of these to be that small! :). I believe both are still in working order (at least, when I plug them in and turn on the switch, lights on the front light up). No probes unfortunately. Best reasonable offer for one or both will get 'em first. They're heavy (at least 60lbs), and big, so please take that into consideration. I am offering them AS-IS. You can contact me at the address in the reply header.

Recently been test-firing a Nice Drake 2B and matching speaker that I've had for a while. I works great. Well, tonite, just after sundown, I tried her again, on my big off-center 80m dipole, and the light-dimmer buzz was horrendous! I understand that stuff comes built-into the LW band, and the BC band, and 80/75 gets the leftovers.

But this was S9 on 18 MC, and not much less on 10m! And of course plentiful on 40m and 20m. After checking the known buzz-bombs in my house, I looked out the window and saw that many neighbors have their Xmas lights up already. And I remembered that some years ago I bought a large set with a built-in cycling dimmer, and what a noise generator that dimmer was. And of course the neighbors' noise generators have "antennas" strung along the eaves and over the shrubs.

Do most Hams and SWLs and BCB-DXers, BA or SS, find the holiday season a good time to tear into their gear for maintenance, vacation in the tropics, or find other hobby pursuits that don't involve listening to a radio? OK, I could copy the usual 3880 AM gang, but it wasn't fun.

Happy New Year -- when we'll get the ether back. 73, Mike K. AA1UK

Source record: 36239

One trick that works very well is to use an emitter follower
instead of a modulation transformer....

If the transmitter, unmodulated , is designed to work at
14 volts, the B+ supply to the emitter follower collector
would be +28 (plus 3 ro 4 volts for headroom).

As you audio modulate the base of the transistor, the
emitter will then go from zero to 28 volts (ideal) exactly as
would be supplied by the modulation transformer.

This is the way that the AM transmitters in aircraft radios
have been done for the last 30 years. It works well.

You should use a hefty transistor, like a 2n6354 or similar,
and heat sink it very well......
Without going into the details , this is an alternative to
using an expensive, and frequency limited, modulation
transformer...... Hope it helps.

Mine has the 4 holes (at 12, 3, 6, 9 o'clock), but the case is brass
not plated. The max diameter of the door is 6 3/4".

Agree the curator has never been to sea (I have met him personally)
but was a professional clock restorer for many years before becoming
museum curator. It seems an odd that he would suggest such a
performance from the clock unless he was fairly confident that this
could have been the case.

"Both" clocks were similar and didn't make the full week before
overhaul, so I don't think the repairman shortened the spring. That
was one reason for getting him to look at them, the others being that
the speed adjustment needed more than the maximum on the lever under
the 12 and the missing seconds hands (he found some red ones that look
good).

I date back to the 40's and the Tramp Business was still in full swing
until the 60's - mainly Brits and Greeks. Two year voyages were still
fairly common then. Ancient tonnage that the Kriegsmarine missed.
Comtainer ships and the larger Tankers changed all that.The Shipping
Business changed radically from then on as you know. Tough to make a
buck. Third World crew savings but increased costs.

There were a lot of very odd characters at sea, thats for sure :-)

Best

Alex

4423. Transmitter tuning question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-12-10 13:00:58 UTC
From: Bob Fay <robert.fay@unisys-nospam.com>
Message-ID: <at4oia$21qg$1@si05.rsvl.unisys.com>
Source record: 36146

I just bought a TS-520SE with tube finals. When I was a kid I had a globe scout that tuned pretty much as the book says it should and I guess I expected this radio to behave somewhat like the scout did. Since I am used to no-tune transistorized rigs now I have a couple of questions:
1. The tuning process in the book says to set the plate bias at 60ma. which I did. It was set to 110ma. Is this a critical setting?
2. It then says to go to the TUN position and peak ALC with the DRIVE. I did this and it is ok.
3. Then it says to dip the Ip with the PLATE control. I get an almost imperceptible dip. Is this normal?
4. Then it says to peak the RF in CW mode with the LOAD control which I did at about 120watts on 40m. When I do this the RF output starts jumping around.
5. I assume when I would like to run this radio at reduced power this would be controlled by the OUTPUT control in CW or the AUDIO control in SSB.

Thanks
Bob WC0D

|to no-tune transistorized rigs now I have a couple of questions:
|1. The tuning process in the book says to set the plate bias at 60ma. which
|I did. It was set to 110ma. Is this a critical setting?

Yes. If the quiescent plate current is too low, intermodulation
distortion will be excessive. If it is too high, excessive
dissipation and lower efficiency result.

|2. It then says to go to the TUN position and peak ALC with the DRIVE. I
|did this and it is ok.

Check.

|3. Then it says to dip the Ip with the PLATE control. I get an almost
|imperceptible dip. Is this normal?

This will depend on the setting of the loading control. If the
loading is light (load control counter-clockwise) the dip will be more
pronounced. As you increase loading, the plate current for a given
ammount of drive, will increase and the dip will become less
pronounced.

|4. Then it says to peak the RF in CW mode with the LOAD control which I did
|at about 120watts on 40m. When I do this the RF output starts jumping
|around.

Following a change in loading, you *must* retune the plate tuning. If
the final amplifier was perfectly neutralized, the plate current dip
and maximum rf output would coincide. This is hardly ever the case in
practice and the final adjustment should be to adjust the plate
tuning for maximum rf output, consistant with the maximum allowable
plate current.

If near the end of this procedure there is still the erratic behavior
that you mention, it suggests that something is amiss. You may have
to check the neutralization (I believe, but do not know, that this
radio has an adjustment procedure for this).

|5. I assume when I would like to run this radio at reduced power this would
|be controlled by the OUTPUT control in CW or the AUDIO control in SSB.

It is generally not good practice to try too much power reduction by turning down the audio gain. Carrier suppression suffers since the carrier leakage through the balanced modulator remains constant. So when the audio level is reduced, the *ratio* between the two is reduced.

Boatanchor is a jargon term for old Radio equipment. In the old days (before solid state) vacuum tubes required very heavy transformers and parts with metal chassis and cabinets -- so some weighed in at 100 pounds plus. Especially the Military Surplus gear that Hams converted to Amateur Radio work. But commercial gear of the day manufactured for Hams was also very heavy and bulky.

The origin of the term boatanchor has been lost in the mists of history -- but here are a coupla guesses.

ORIGINS OF BOATANCHOR

THREE VERSIONS -- Opinions From The Internet.

Version I -- During World War II, Military Radio Techs used the term BoatAnchor as they
struggled with the huge, heavy, electronic equipments of the day -- full of transformers, tubes etc.
Also the US Navy frequently marked electronic gear with an anchor. After the war -- tons of
the equipment appeared on the surplus market and was dubbed BoatAnchors due to the reasons
above - one or both.

Version II -- After WWII a national magazine editor answered a query "As what to do with an
outdated heavy, large, surplus electronic instrument?" and answered "Tie a line to it and use it
as a BoatAnchor"

Version III To all those who expressed interest in the CQ magazine reference to boatanchors,
I found it after only an hour or two of skimming. And I also found that some of my recollections

were a bit hazy after all those years.

The original letter to the editor (not to the "Surplus Editor" as I incorrectly recalled) appeared on
page 16 of the October 1956 issue of CQ and was as follows:

Gentlemen:

I recently acquired a "Signal Corps Wireless Set. No. 19 MK II Transceiver." Are there
schematics or conversion data for this rig? Any info will be appreciated.

David J. Wilke W3LSG Pottstown, Pennsylvania

The editor replied:

The only conversion we seem to have on the files here at CQ calls for 100 feet of 1" Manila line,
one end of which is to be tied securely around the MK II Transceiver. This then converts the unit
into a fine anchor for a small boat. If any readers have better conversions we will be glad to
hearabout them.

Ed.

This letter apparently generated a lot of interest and in the February 1957 issue of CQ there
was a follow-up from CQ's editor, another letter from W3LSG and several pictures. If I find
the time I will scan them and post links to them here.

The expression "boatanchor" may have originated earlier than 1956, as Doug Hensley pointed
out. I found no earlier references in amateur radio than these CQ's, but there may be some.
However, there was no reason to call amateur gear of that era "boatanchors" since almost
all of it fit thatdescription. It wasn't till later when smaller, lighter gear became popular that there
was reason to categorize some gear as boatanchors. And it is also interesting to me that a word
originally used to denote something of little value, useful only to anchor a small boat, has taken
on a more affectionate meaning. We love our "boatanchors".

Don't malign the #19 set. In 1948, as a 18 year old teenager, I bought a brand new surplus #19 set in the original wooden packing case. Inside the contents were wrapped in orange oil skins. For $29.00 I got the #19 set transceiver that covered from 2 to 8 Mcs (before MHZ) also a UHF 240 Mcs transceiver and all the antennas and cables, microphones and earphones. Plus the 24 VDc dynamotor power supply. When I got my license in March 1950 the HF receiver portion was my station receiver. Many QSO's. The UHF , super regenerative transceiver was coil modified to 2 meters and provided local contacts. A venerable W.W.II unit that maybe didn't match others but was in virtually all British, Canadian and Russian tanks. However that being said, it was a hernia maker at about 100 pounds and would have held a fairly good size vessel in a strong breeze. Keith, VE3JKC.

>horrendous!

Just wanted to clarify, why a Drake 2B doesn't like Xmas lights either -- its
otherwise very effective ANL cuts out in SSB mode (PD and BFO both on).

BTW, is the 2B the only radio with two separate switches, one for BFO on/off,a
nd the other to choose between product detector and diode?
Was this for CW ops who preferred the old scheme? And maybe needed the noise
limiter? I find that in the tight CW selectivity mode, CW signals really pop
up out of all that noise.

Because it's fun, and it's pretty good considering it's all one tube.
I built something like that when I was twelve and it worked surprisingly
well for less than five dollars in parts. Parts costs are higher today,
but not that much more.

Compactrons are just neat as hell.

>I am designing an extremely low power (<<1 W input) solid state AM
>transmitter and have encountered several difficulties including how
>to determine the impedance of the modulation transformer.

You just order the transformer with whatever impedance you want.
If you are using a junk transformer, you can put a square wave through it
and adjust a termination resistance until the square wave on the output
really is square, which tells you what the optimal load impedance on it
is.

70V PA system transformers on a 10W tap will give you an 8 ohm to 500 ohm
ratio, which is handy for a lot of things, and they are dirt cheap.

>Suggestions on this or anything else (operating points etc) would be
>appreciated.

Operating point? Well, wherever it's most linear, of course. With only
1W input, you can afford to throw power away and just run everything
class A.

I am seeking two specific Command Set ("ARC-5") receivers.
I will pay premium for unmodified sets in good condition.
Will negotiate favorably for these sets in any condition.
They *must* have one of the tags shown in the link below:

http://home.mindspring.com/~arc5@ix.netcom.com/274tags.jpg

Note that these sets are *ARMY* and made by Aircraft Radio Corp.,
not Western Electric or Colonial.

Also interested in any accessories so marked.

Thanks.

Source record: 36161

Hello
I have a FT 920 with the AM filter and FM board. The FT 920 is 100
watts HF + 6 Meters. It has a Auto tuner and the MC 100 Desk Mic. I
also Have the 3 KW Roller Inductor Antenna Tuner. They are in good shape
I will trade both for a FT 990 or a FT 1000.. I have been using the FT 920 as a backup rig.
If you have a FT 1000D I will add a Henry Radio 2KD-5 Amplifier to
the deal. 100 watts in gets you about 1000 watts out. I will trade this 2KD 5 Henry amp for a FT 990 or a FT 1000. It has new caps
and a pair of Emac 3-500. It is wired for Single Phase 240. The same
voltage that runs your dryer and electric range.
I also have a Icom AT 500 auto tuner. This tuner will handle 500 watts. It works fine and I have no use for ICOM equipment. My station is all Yaesu at this time. I will trade this tuner for a Kenwood TS 50, or other small HF Gen. coverage rig, or a good Short wave receiver. I also have a Pentium III 500 Mhz computer for trade. It has 128Mb ram, CD burner 52X CD rom S3 Virge video card, 1Gb hard drive, 10/100 Mb network card, Motorola SM 56 modem, Yamaha sound card in a ATX tower. Of corse keyboard and mouse included. I will trade this computer for 350 bucs plus shiping or a good HF moblie rig.
I am will to travel 100 miles from Athens GA. Drop me a email so we can work out the deal.
oris@dirtball.com
Happy Holidays

The used 2K4 I bought suffered some kind of disaster inside the little aluminum box containing the bridge. Someone probably tried to put a kilowatt into an open circuit. The inside of the box is blackened, and spotted with fine particles of molten metal. As a repair, some previous owner simply removed most of what was in there, leaving the toroid around the center conductor, and the two .01 caps on the RCA jacks. I have a corrected copy of the schematic, and would like to obtain a few pieces of additional data before I tackle rebuilding it.

The drawing (SWR Bridge, December 1970, By: WCK) shows a unterminated winding (L80) grounded on one end, and apparently wrapped around the center conductor. There was a short piece of magnet wire still stuck inside the insulator in the center of the toroid, and I suspect this must have been a simple Faraday shield. How many turns, and what spacing was it? And, how many turns in the main coupling winding around the toroid (L81)? I count 64 remaining on this one, which may be close to the original number.

Second, some component values. The trimmers (C80 & 87) connected to the center conductor were probably in the range of 7 pf. Is that correct?

Are the RF chokes (incorrectly shown as C82 & 84) 0.5 or 1 mH, or something else?

The SWR bridge shown in many ARRL Antenna Handbooks looks very similar to what is shown on the Henry schematic, so I am using it for some guidance. Has anyone else compared the two?

All constructive comments appreciated, and yes, Reg, I know measuring SWR doesn't tell you much. I just want it for a relative output indicator.

I am listing nearly 100 items, most of them rare and highly desirable
Please feel free to look
I have everything from Keys, Collins, National, Hammerlund, Hallicrafters
and so many more very nice items.
This is my idea of having a good clear out.

About 6 months ago, someone was parting out an SB-220 on eBay. I've
seen some pretty esoteric components go up for auction.

4451. Stub-line Transformers. New program.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-12-11 15:56:57 UTC
From: Reg Edwards <g4fgq.regp@btinternet.com>
Message-ID: <at7n88rjd9@sparta.btinternet.com>
Source record: 36174

NOW AVAILABLE

New Program " STUBTUNE.exe "

This program assists with the design of stub-line transformers used for such purposes as matching the feedpoint impedance of balanced radio antennas to the Zo impedance of the transmission line from the transmitter. This program is applicable only to balanced-pair lines. Transmission efficiency theough the transformer is calculated.

It is an improved version of program STUMATCH.exe in that it takes into account conductor loss in the transformer and is therefore more accurate when extreme ratios of (Antenna Impedance)/(Feedline Zo) are involved. Operating procedure is more complicated than STUMATCH. However it performs calculations beyond the facilities offered by the Smith Chart,

The program is peculiar in that the Zo of the feedline is not entered. All input data is variable in small up/down increments until the input impedance of the transformer is equal to the Zo of the line to be matched. Educational.

STUBTUNE is self-contained in one small file, download in a few seconds from website below and see how it runs.

I have been checking the web looking for a supply of new or NOS
push-pull audio transformers. AES has them, but I am looking for
100-200 of them, so retail isn't the way to go.

Lots of people have the little ones for transistors, but I am looking
for 2500-3000 ohms tube plate to 4-8 speaker.

Anyone know of a supplier?

TIA,

Steve.

Yo Mike - not wishing to pre-empt an edifying response from Alex: The last big recips on our side of the pond were Libertys; some were still operating non-condensing on the Great Lakes as late as the early '70's. My MMA class was one of the last trained in recip hands-on & design theory & operation. Perversely, most present-day shipyards cannot properly overhaul & adjust a simple recip pump - it has become a forgotten technology. :-) FWIW when they were constructed, turbines were already in vogue & more efficient - the recips plants were quicker & more expedient to build, and required less training to operate during wartime conditions. You may be aware that the wordl record for fast shipbuilding was recip Liberty at South Portland, with about 2 days from keel-laying to lanch for outfitting (and we are talking the Rosie Riveter days before hull welding). The same pragmatic priorities produced the famous turbo-electric tankers of the era (T-2's), which could be operated just by controlling a big 3-phase synchronous motor. It should be noted that turbine plants were also being built at almost the same time - most noteably the C-2/C-3/C-4 series of dry cargo vessels. All of these designs saw long use (allowing for various layups in-betweeen) well into the '70's, either in their original configs or as popular conversions, both in American fleets & internationally. Some T-2's were permanently moored & used as shoreside powerplants. The world's first true chemical parcel tanker - S/S Alchemist - was a T-2 aftership & foreship with a new midbody (I husbanded her as Superintendent).

There is something romantic about throwing the links on a big recip, and having it instantly reverse at full power - that is, if one can keep from slugging it with boiler carryover. :-)

These all were DC ships, and the R/O had a substantial battery bank for all the times that we would lose the plant.

I have this unit remaining from friends estate. Much too large for my small shack...want to trade or sell for something useful to me. Unit powers up etc and it did have power output a few years ago when he and I ran the station for fun of it. Needs minor cosmetic attention. Sat covered for several years. The matching SX-101A has been sold. Asking $200. area with a manual re-pro. Will consider a meet WNY- ENY, maybe south to Penna. as I have to go to Philly during next 2 weeks. Will be a bugger to ship 100lbs but I can do so at added expense(s). Need more info: reply---will try to assist. I do have a couple pix available.

Its one of those Internet Explorer *only* sites so you might not be able to use it. There's no ordering info there.

I did my transaction via email...here's their reply with a real person's email address and phone number.

From: "Sue Brick (JAN Crystals Sales)" <sueb@jancrystals.com>
To: "Bill M" <exray@ribe.net>
Subject: Re: FT-243 xtals
Date: Tue, 10 Dec 2002 08:21:20 -0500

Bill,
We can provide the HC17/U which is equivalent to the FT243 in pin size and diameter. These crystals are usually made at 32pF and 50ppm. The cost is $11.00 each + s/h, however, we do have a $20.00 minimum. Standard production time is 3 weeks (4 wks. now as we will be closed between xmas and the new yr.) with expediting available at an additional charge if you should need it sooner. We accept Visa or Mastercard. Should you wish to phone, the number is 800 526 9825. Thank you for the inquiry.
Regards,
Sue Brick, Sales Mgr.

A small caveat: a FT-243 pressure mount crystal can handle considerably more current than the miniature crystals are capable of. Using a HCxx in an oscillator with say a 6L6 or similar will probably fracture the quartz.

You can also remove pins from a defunct octal tube and convert the smaller pin crystal cans to the larger size.

Pete

4476. Drake 2B ANL question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-12-12 17:26:06 UTC
From: knudsenmj@aol.com.Oscar
Message-ID: <20021212122606.19512.00000004@mb-bd.aol.com>
Source record: 36099

On my Drake 2B, the noise limter doesn't work when in the BFO and
Product-Detector mode (SSB, and better in my opinion for CW).
Is this normal, or should I dig into the radio?
Seems like an unnecessary oversight in a radio with a product detector.

Just for fun, anyone know of any other RX where there are separate switches for
BFO on/off and diode versus product detector?

Did old CW hands still prefer the BFO and diode combo?
Tnx es 73, Mike K. AA1UK

> Tnx es 73, Mike K. AA1UK

It's similar to the difference between using Fast AGC vs Slow AGC for CW.
Unless the signal is stronger than 9 acres of horseradish, Fast AGC allows
for better copy than Slow AGC.

The ANL does not function when the product detector is turned on- not unuusal for rigs of this vintage. till, the 2B (especially w/ the 2BQ) is an excellent RX- play mine daily.

Hammond will sell directly if you call them with an order of that size.

If you want cheaper than Hammond, there are a lot of custom transformer places that can probably make up up one. Meh Ah in Hong Kong is a nice one. Check the transformer section of the EEM. These guys will probably require ordering 500 to 1000, though.

For 5W... if you can survive with somewhat lower fidelity... uhh.. you can use standard filament transformers for that ratio. The Talema toroids don't sound bad at all. Don't tell your customers....

BUT, if you have old FT-243 crystals in the 4 MHz region, it is not too
hard to polish them down to 80M. I used do that as a kid, buying cheap
surplus crystals by the bag and moving them into the ham band when I was
a rockbound novice. At least, until my mom started getting angry about
my making messes with jeweler's rouge and Ajax cleanser in the sink.

WOW! What fun reading his negative feedbacks! Quite a hoot (no, I was never one of the sorry souls who bought his 'mint/pristine/very smart (what exactly does THAT mean, Marty?' stuff.

Just take a few moments and read his negatives. "Yeah so what I overcharged you on packing and shipped it barely alive on something that I overly stated in my ad as being mint and all there - you should have emailed before leaving feedback" is the thrust of most of them.

Folks like this are what give honest Ebayers a bad name!

Caveat Emptor.

George

After reading much whining about posters advertising their "For Auction", I need advice ...

I have a Motorola base station power supply for sale, Now ....do I post it here as "for Sale"

or should I just go ahead and put it on EBAY and never again mention it here in this forum.

Some one in this group could miss out if I don't mention it here ..... on the other hand if I do,

well you know!

best answers will make my decision

Thanks "Tony" N9YRQ

IIRC it is exactly that - a diode clipper across the AM diode
detector so is not operative when the audio comes from the
product detector.

OK, your answer seems to imply "yes, BFO and diode detector are better for weak
CW signals."

FWIW, the 2B also has a separate AGC fast/slow switch! Three switches to go
from AM to SSB (though maybe only one or two to go to CW). Later RX, you
rotate one knob from AM to SSB and all those mode changes happen.

But Drake certainly gave you flexibility, and assumed you knew what was
happening.

I can understand that the ANL doesn't have the DC signal level from the diode
detector to work from, but should (might?) have the DC from the diode detector
that's feeding the AGC. At least, I'm assuming that the 2B is modern enough
that the AGC works with BFO and PD engaged, being a "designed for SSB" RX.

I like my 2B too -- sensitive and easy to handle effectively. The audio could
be crisper, especially on AM, where the 3.5 MC maximum BW is too narrow for Ham
or SWL work. Might be the first RX to really short-sheet AM quality, certainly
not the last! --Mike K. AA1UK

Simple:

If FOR SALE (you want to sell via email directly on this group) post
with a subject line like:

FS: Motorola Base station w/ps

If FOR AUCTION on Ebay or anywhere else:

FA: Motorola Base station on Ebay

And in the body past the Ebay link (here's a sample):

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=744957002

Be sure to have your Newsgroup Reader program set to post/display
80 characters or wider or else the link won't format correctly and can't
be clicked on.

The WORST thing to do? Post a For Auction item with a For Sale
lead in the subject line! You'll be flamed into your next life for that.

Hope this helps.

George

I recall a CAP member whose expertise was in grinding crystals for the program. He was able to grind (lap) crystals from fairly far away (in freq). I do recall that he used a mirror for his grinding surface and Bon Ami as the grinding agent. I also recall that he would also have to lap the edges and use one of the fluoride solutions to restore "activity" after the surface had be ground. It was, indeed, an art!!!

Noted radio collector Steve Conklin of East Hampton, NY has passed away. Steve was a boatanchor collector with AR-77s, RA-17. RA-153, Lagier and other rarities in his collection. Almost totally blinded by diabetes, he continued his collecting and managed to repair quite a few radios with the help of magnifying glasses. Previously he had owned the most eclectic TV-Radio repair I shop I had ever seen (on Gingerbad Lane in East Hampton).
His ashes will be spread over the old RCA Radio Central shortwave station on Long Island, as per his wishes. He was 49.
RIP Steve

I presume those caps bridge the connectors and offer part of the
low-pass output.

>
>The drawing (SWR Bridge, December 1970, By: WCK) shows a unterminated

Sounds like a candidate for failure if you attempt to follow through
on that thought.

>There was a short piece of magnet wire still stuck inside the
>insulator in the center of the toroid, and I suspect this must have been a
>simple Faraday shield.

A piece of wire would be hard pressed to serve that function. Stuck
in the insulator? Descriptive, but not very informing.

>How many turns, and what spacing was it? And, how
>many turns in the main coupling winding around the toroid (L81)? I count 64
>remaining on this one, which may be close to the original number.

Well, at least that offers some place to start. It also suggests a
good amount of isolation, but simultaneously brings the prospects of
becoming tuned at an inappropriate frequency through stray
capacitance, perhaps this is justifies your assumption of there being
a faraday shield.

>
>Second, some component values. The trimmers (C80 & 87) connected to the
>center conductor were probably in the range of 7 pf. Is that correct?

Seems reasonable, but I doubt both are the same value as they form a
divider that will offer roughly the same ratio as the two resistors or

other coupling ratio this circuit uses.

>
>Are the RF chokes (incorrectly shown as C82 & 84) 0.5 or 1 mH, or something
>else?

Again, this and the 0.01 caps serve to filter the products of both
rectified outputs in the design.

>doesn't tell you much. I just want it for a relative output indicator.

Hi George,

Seems like the handbook would offer enough clues (I can't see either
your schematic nor the one you cite from the handbook). There must be
about a dozen passive components here: one transformer with three
(some are two) connections, two caps coupling from it, two resistors
terminating the secondary, two diodes, two diode loads (probably
variable to calibrate forward and reverse scales and perhaps more
resistors simply to limit range of adjustment), two chokes and two
caps to filter the metering current derived from the loads. There are
variations to this design that all go towards the same goal and their
size and connections vary accordingly, but generally show a symmetry.

The only mystery that remains is the winding ratio, 1:64, and the
shielding. The ratio seems OK. If you add a shield, it can only be
terminated at one end, otherwise you short out the induced signal (and
would probably blow the wire like a fuse). Skip the shield and test
the ratio by building the Handbook circuit. If the forward to back is
out of whack, the turns ratio is off, or the capacitive divider is.
Choose one and vary it (the ratio of the caps or the turns). Examine
the two caps or their values in the schematics and determine what
range of ratios they would support.

4500. Ten Tec Triton 540 tuning question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-12-13 10:53:23 UTC
From: gil <gilpi@mindspring.com>
Message-ID: <atcdhnoma1@slb2.atl.mindspring.net>
Source record: 36123

Just got a nice Triton IV 540 works well but the tuning seems to be a bit on the "loose" side and towards the end of the scale actually feels like it slips. Is there a way to get a more "positive" feel to the tuning? Maybe tightening the tuning cord a bit?
I also read about "greasing the PTO" ?

Really like this rig and maybe one of you Ten Tec veterans can guide me in the right direction.

Thanks for the read

Merry Christmas

Gil

4 MHz is above 80 meters. Grinding a 4 MHz crystal would raise the
frequency, not lower it towards 3.5 MHz.

It's not that hard to get it close enough to be reasonably stable. It's
not so easy to get it to meet broadcast specs, but if you don't mind a
little drift, it's okay. Either it oscillates or it doesn't, pretty much.

Don't find a 5R3 in my books, do you mean a 5R4?

1. The 5R4 is bad.
2. There is a short or low impedance path from B+ to ground - suspect the electrolytic first.
3. With tube out, and power off for at least 12 hours, use an ohmmeter to measure between pin 8 of the 5R4 and ground. Should be 20,000 ohms or higher. If not, something is wrong. If not #2 then find it and fix it.

Polishing a crystal "dont" move em down in frequency. Polishing them with jewlers rouge brings them UP in frequency. Same as using Ajax/Brasso ect! Rubbing a led pencil on the crystal will bring it "down" in frequency but will effect the activity! Been there/done that in the mid 50's Also IF you try moving them UP to much, Remember to also read the articals on grinding and do "edges" at the proper angle.

It's arcing over because it's got way too much of a load on the output.

When you pull it out, the transformer is seeing no load at all and is
totally disconnected from the power supply, so the fuse does not blow.

Pull the other tubes. If it still arcs over, the supply caps are shorted.

Hello folks,
I have manuals for Drake equipment in PDF form. These would be for the 1A, 2B, 2C, R4A, R4B,R4C,
SPR-4, SW4 FS4, R7, R8, TR3, TR4, TR4C, T4X, TR6,TR7, UV3, MN2000, and other tuners. Also, I have the '7 series owners and service manuals, along with manuals for the RR-1, MSR-2, etc.
Price, including shipping in the USA will be $18.00 for each manual. In cases such as with the TR7, I will include both the Owners Manual and the Service manual for that price. With overseas customers, we will need to discuss shipping first.
Any interested parties can e-mail me directly.

Pete Gianakopoulos
Mount Prospect, Illinois
USA

I *think*, Martyn, that on an SX-28 (and some other older Halliscratcher rx's)
that the B+ is removed, or certainly lowered on one stage of the receiver.

Read up on it at the Bama site...

ftp://bama.sbc.edu/downloads/hallicra/sx28mil/

Happy Holidays

>The tube is definitely a 5Z3, four pin tube

Ah, if you'd said it was an SX-28 I could have elaborated. Most likely the problem is C49 and/or C48, they are the capacitors in the metal clips under the chassis on the left side as viewed from the back. C49 is 30MF 450V and C48 is 30Mf 400V. The common 47MF 450V electrolytic available from several sources is an acceptable replacement. You will need to add a terminal strip to make it look neat, or replace the guts of the old cans if you want it to look authentic. I don't know anyone who does the latter for SX-28's, as they are so heavy nobody looks at the underside.

There is a very good restoration article at:
http://www.antiqueradio.org/halli12.htm

It's a great receiver, and worth doing right.

Doug Moore

Martyn posted:
<< Has anyone experienced a 5R3 tube arching like one of those lightening lamps??
After 5 seconds the fuse blows
Leave the tube out and the set lights up and the fuse does not blow
Anyone have any ideas??
Many thanks
Martyn >>

I've read all the replies so far, and agree that it is very likely a B+ filter cap (C48 or C49) that is shorted..... at least it's a good place to start.

However - DO NOT pull all the tubes except the 5R3 and then turn on the receiver. That would subject most of the capacitors to a "no-load" voltage magnitude that could fail them.

Has this receiver worked since you bought it? If not, you should check the wiring of SO1 and it's plug to see if they have been modified. Also it would be a good idea to check the wires on the "5R3" socket against the 5R3 tube schematic to see if a tube type replacement has been made.

Don

>'70's.

My family rode the big ferry across Lake Michigan to Milwaukee in the very late 40s, and my old brother claims to have snuck down in the engine room and seen the real thing (not some dull screaming turbine).

Nice fresh lake water can go right into the boilers, no condenser needed, eh?

> FWIW when they were constructed, turbines
>were already in vogue & more efficient - the recips plants were
>quicker & more expedient to build, and required less training to
>operate during wartime conditions.

Yes, turbines were becoming standard even when the Titanic was built (she had one on the center screw). I also heard that Liberty ships used recips to conserve the special high-temp metal alloys that turbines would have needed. Long life wasn't a concern, thanks to the U-Boat fleet.

> The same
>pragmatic priorities produced the famous turbo-electric tankers of the
>era (T-2's), which could be operated just by controlling a big 3-phase
>synchronous motor.

Synchronous motor on a screw? How do you vary the speed? I know the Morro Castle was turbo-electric. Should be a very flexible power system.

>There is something romantic about throwing the links on a big recip,
>and having it instantly reverse at full power - that is, if one can
>keep from slugging it with boiler carryover. :-)

I always considered that a major advantage of recips -- ability to reverse instantly in an emergency. In the "Titanic" movie, they shut the engines at least partway down before shoving the links over, wasting precious time.

>These all were DC ships, and the R/O had a substantial battery bank
>for all the times that we would lose the plant.

Must be hard to generate AC form an engine with such a wide speed range. You'd have MG sets where AC was absolutely necessary, right?

If you call Ten-Tec in Tennessee, they can sell you a PTO rebuild kit.
It comes with all the small parts that wear within the PTO plus their
long lasting grease. The last I knew, they charged around $21 for the
kit. The kit comes with very detailed instructions about rebuilding
the PTO.

I rebuilt about 4 PTO's on a Triton, Omni-D, Corsair, etc. It takes
me about 2- 3 hours, depending upon the model of the rig.

While you've got the Triton open, replace the elastic cord that drives
the dial needle. Ten-Tec will also sell you that for around $2.

Ten-Tec sells parts for almost every rig they ever made.

The last reciprocating steam vessel that I've seen in commercial use
was a ferry used by the Wood's Hole, Martha's Vineyard and Nantucket
Steamship Authority.

I believe it was called the Neoshon and was used into the early
1990's. It had two reciprocating steam Skinner engines.
It was a single ended ferry about 300 feet long.
It was replaced by a typical double ended diesel engined vessel.

One reason the authority wanted to get rid of it was to save labor
costs. They had to keep an engineer onboard overnight to maintain
boiler steam pressure so that things wouldn't freeze up in winter
time.

There are two museum Liberty ships still operating, named (I think)
the John W.Brown and the Edmund O'Brien.

I visited the John W. Brown when it voyaged to New London, CT from
Philadelphia about 4 years ago. The volunteer crew is doing a great
job. They were involved in a fund raiser, having folks pledge to buy a
new hull rivet at something like $15/ea for the next shipyard visit.
I was amused to see that they have installed a standard Weil-McClain
oil fired home heating boiler in the engine room to provide for
standby steam . The ship had in effect, two radio rooms. One has the
original equipment with the old RCA console and the other is set up
for Amateur radio.

Source record: 36059

Lots of talk about the radio rooms on Liberty ships, but not a lot of talk about the radios in the radio rooms on those liberty ships.

to that end, I have a question:
What was the reason for the MCW useage?
Are any of those transmitters still around?
Why did they use that RCA Modulation transformer, with such a low secondary current limitation?

(I found this mention, but I wonder if anyone else has more info on these modulation transformers)

==========
Since WWII, there must have been a jillion 1:1 ratio open-frame RCA modulation transformers sold on the surplus market. These transformers have primary and secondary impedances of 5500 ohms, and have a tertiary winding for modulating the
screen. They will modulate a kilowatt DC input, but the frequency response is not that great, and there seems to be substantial waveform and phase shift distortion at most audio frequencies. Many hams have used these transformers in the post-WWII years, and they are probably at least as good quality as the typical ham radio modulation transformers such as the Stancor and Thordarson 500 watt multi-match units. There were probably more of these RCA transformers used in postwar homebrew AM kilowatts than any other transformer. The main disadvantage was the unfavourable turns ratio that didn't match most commonly used modulator tubes very well.

I have seen dozens of ads for these transformers over the years and many have shown up at hamfests, but I have never seen any trace of the transmitter they were designed for. Nobody I ever talked to has had any more information on these
transformers than I had, until tonight. I contacted W3GL, Ralph in Delaware, who used to work for RCA. He told me he was familiar with these transformers and that they were manufactured to convert the CW transmitters used aboard Liberty Ships to
tone modulated cw (type A-2 emission). Therefore, the frequency response and phase distortion characteristics were not important, as long as they worked well in the vicinity of 800 cps. He thinks they were disigned for a tube lineup of 813's in both
modulator and final.

This is by far the most plausable story I have ever heard concerning these transformers.
==========

Does anyone have any other info on the "Liberty Ship Transmitters" using this
RCA modulation transformer?

Many of the automatic distress alarm receivers were designed to respond
only to signals with an audio component. MCW was required on the 500KHz
calling/distress frequency to enable these to work.

Also I think MCW was a used on the 500KHz calling frequency so that a
call wouldn't be missed by being zero-beat with the reciever bfo.

You could at least mention what state, and even the city that its
in. That is a lot of equipment to move. I moved and rebuilt a RCA
TTU-25B about 15 years ago. That took four of the large U-haul trucks
loaded close to the weight limit for the transmitter, antenna, cooling
system and spare parts. Then I hauled several car loads of parts and
hardware to the site as I rebuilt the transmitter at a new TV station.

I moved a Gates 5 KW a couple years ago. That was two trips with my
truck and trailer, then we had to hire a truck with a lift to move the
transformers.

Hi All:

Just a lurker, but iirc there were a lot of coastal marine stations
working in the 400-500khz bands back in the 20-30-40's. in cw.
Plus the distress 500kc channel.

4557. newbie questions - Hallicrafters SX-73 (R274D)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-12-15 00:16:41 UTC
From: geowulf <wulfmusicdontspamme@home.com>
Message-ID: <sv9nvuo6dqu3iqt6n6ajhh27lh5p9s6e3p@4ax.com>
Source record: 36080

Hi! While I'm not exactly a newbie to boatanchors (I've had a SX-100 for about 10 yrs, and I also work on tube guitar amps for fun and profit), I've never aligned one and have some questions. First, some background. I'm not a ham, but have been toying with the idea for quite a while. I do a lot of SWL, but my listening hrs have decreased substantially since the Internet came into the picture. Most of my listening is on a Sony ICF-2010. Before that, I used the SX-100, and I first started listening on an old Philco 40-180 console that I electrically restored. Anyway, about 10 years ago, a friend of mine at work said he had an old tube radio that he wanted to get rid of, so I went over and picked it up. Big, greeen, dirty, and ugly, no identifying marks on it, didn't know if it was a transceiver or what (send/rx switch). It has sat in my basement ever since...at one time, I thought I didn't want it around anymore, so I put it in my garage sale for $5. Luckily, there were no takers. Last week, I got a wild hair and decided to check this thing out. Opened it up and found the schematic on the inside of the top cover...hmm, R-274D made by Hallicrafters, looks like a receiver. Found the manual on the Internet (thanks to Don Gilson, KC7YDB). It needed a line cord, so I put one on and fired it up. No 600 ohm speaker handy, so I hooked the phone out to my Mackie mixing board and listened thru the studio monitors (I'm a musician). Stuck a meter lead in the antenna jack. Lotsa crackling noise, no stations. Cleaned the pots and contacts on the monster turret assembly, and behold!!!! Pulling in all kindsa stuff. Yesterday, had the day off, so I strung up 75' of #14 stranded Cu, hooked up a balun (hadn't bothered to put up an antenna since I moved 4 yrs ago) and drilled a hole thru the side of my house to the basement. This receiver is a killer!!!! I can't believe the stuff I'm pulling in. BFO doesn't work, but I'm pretty sure I can get that going. There are two issues I have with this radio, however:

1. The selectivity switch works best in the narrow position. If I switch to med, I lose a lot of signal on the S meter. If I set it to wide, there's too much annoying noise, even when there are no adjacent stations.

Will aligning the I.F. fix this?

2. The frequency dial is off. I set it to WWV at 10MHz (loosened the setscrew and moved the dial), so the 7-14 MC band is pretty close, but the rest of the bands are off.

Will aligning the H.F. fix this?

Other questions:

3. In the manual, a non-conductive screwdriver is recommended for adjusting the transformer slug inside adjustment. The outside adjustment is bigger than any fiberglass screwdriver I've ever seen. Is it OK to use a metal screwdriver for this, or do they make non-conductive tweaker with a 1/4"+ blade?

4. Voltage values are given for the signal to be injected into the IF and RF stages. Is this a p-p value, or RMS (avg)? My fluke 8060A won't work up to 455 KHz, let alone 54 MHz. I do, however, have a 200MHz scope.

5. I have a transformer on order from Antique Electronic Supply so I can use this radio with normal speakers (should sound pretty good thru a 4x12" Marshall cabinet!!!). In the meantime, will I damage the output transformer by not having a 600 ohm dummy load connected?

6. There's a 5kW AM broadcast tower about 1/2 mile from my house. Any insight on whether or not this will affect the alignment? It decreases to 270 watts after sundown, maybe it'd be best to do it at night.

TIA for the help, I'm sure there's a vast well of knowledge on this group.

Thanks,

George Wulf

4558. Bad Tube?

Newsgroup: rec.radio.amateur.boatanchors

Hello,

I have an ailing Graetz shortwave cabinet radio. The radio powers up fine, and sounds wonderful for about 15 minutes. After that, the audio becomes distorted, much like the effect of a blown speaker. Increasing the volume makes the distortion worse. There is virtually NO hum in the audio, just the distortion after warm up. Is it possible that this is bad audio output tube? The tube is an EL-84 (6BQ5). Before I start looking for tubes, I'm wondering if this is possible/likely.

Sounds like it might be a gassy tube. Replace if possile and
certainly if it has a bluish glow after warming up.

> to that end, I have a question:
> What was the reason for the MCW useage?

Hi Geoff,

As far as for the reasons why A2 was used I have a few ideas here, theory #3 is the one I favor the most.

1) In the early days of radio things were simply less regulated and standardized. I beleive there was some thought that A2 cut through the QRN better and thus offer a slight range or reliability advantage. Ship safety and prevention of loss of life at sea were the priorities so anything that might be of communications help was probably welcomed.

2) BFO not needed, so if your RX doesn't have one or it craps out CW reception it still possible. My first exposure to coastal stations such as WSL and others on 500 KC was on the AM radion in my Dad's van; often times they pounded in so loud it seemed the radio was going to fly out of the dashboard!

3) RX design of the time and operator failsafe.
My dad was a radio op on several WWII Liberty ships, and the RXs typically were Mackay (sp?) regen types.

I remember one story he told me of entering the radio room and discovering that the new junior radio op on watch did not have the RX regeneration control advanced enough to be on the sweet spot where CW was copied, thus the gain was reduced and no beat note could be heard on A1 signals. An A2 signal could still be heard under these conditions. I bet the junior op caught it good that day.

> Are any of those transmitters still around?

Just came across this W9GT web page, he has a Federal/Mackay 167B HF marine transmitter. Looks like an excellent boatanchor.

Some of the emergency receivers were actually crystal sets, which
don't copy CW well, but work with MCW.

Now that I have completed my collection of HR magazines I am selling off the spares that I have.

I still need some HR binders (both sizes). Let me know if you have spares.

The magazines are in good to very good shape. Send me your list and I'll let you know what I can fill. Prices are $2/ea for the small format and $1/ea for the larger format. Prices do not include shipping.

If you need a total, give me your zip code and I'll check postal book rate shipment from 72227 to you.

Hello Fellow Lurkers:

Why working medium wave. Mainly because the commercial marine radio comms prior to ww2 was in the low hf and medium wave bands.

Here's a whole bunch of links that *may* give you a place to start reading up on it.

http://www.ncr.dfo.ca/media/backgrou/1998/hq75_e.htm : Canadian Marine Radio History

http://web.onetel.net.uk/~mforeman/trawler.htm 1930-1950 : marine radio pics with links to different equipment.

http://www.gmdss.com.au/history.htm : Australia page radio historical background.

http://indigo.ie/~cguiney/radiostation.html : Valentia Marine Radio station history site.

http://www3.telus.net/radiomuseum/ : SPARC Canadian Radio museum page.

http://www.frontiernet.net/~jadale/Pavek%20Link.htm#Radio%20History : Pavek Museum web links page.

http://www.usmm.org/links.html : U.S. Merchant Marine Museum links page.

http://www.nor.com.au/community/sarc/linkspge.htm#Radio : Summerland Australia Amateur Radio Club links page.

http://www.family-richards.org.uk/bryans_world/newbook.htm : History of UK Merchant Marine Radio Officers.

http://www.qru.de/slow-cw.htm : Long wave cw comms way down in the 135.7-137.0 KHZ (!) amateur ops.

http://www.radiomarine.org/ : KPH Radio Historical site

Just *enough* links to get the curious started.

Course there is always the Public Library....

Ref discussion and questions on use of MCW.

MCW was standard for Marine CW and was used extensively on HF also. Eventually, perhaps in the 50's, - forget now - it was superceded by straight CW except on 500 kcs.

On 8, 12 or 16 Mcs with a really bad fading situation and weak signals - say when working from Aussie waters to Europe - one Sideband might drop out and the other one would still be readable.
Real pleasant to listen to for extended periods too. Especially if hung-over...

Many HF Transmitters were not crystal controlled and had to be set on the Calling frequency with a calibrator - made things interesting at times. Regenerative receivers too. Great CW receivers in the hands of a good Operator....

I disliked the CW tone when it took over HF, but the band crowding and improved equipment made it inevitable. MCW was the norm on MF, but eventually became 500kc only.
Digital and keypads rule now and don't require the skill levels once common. Totally new generations weaned on transistors and digital readouts. Progress.

Talking of Sidebands - Spark was the real killer - key 500kc -or 600m as it was still known - and it could be read comfortably from around 400-1000kcs.

Hope this helps

Best

Alex D. Nicolson

Probably the Amateur Radio 10 Meter Contest. For USA stations -- The 4
symbols is a contest exchange such as 59CA -- first two are a signal report
in the RST System -- last two is the state CA = California, MI = Michigan,
etc

DX stations transmit signal report and sequential serial number starting
with 001. Example 59124 indicates the 124th contact made. A station in
Belgium e.g. ON4UN might give a contest exchange of 591467

For contest rules see URL:
http://www.arrl.org/contests/rules/2002/10-meters.html

RST Signal reporting is at URL:
http://ac6v.com/morseaids.htm#RST

Be aware that in addition to W and K callsigns -- the USA has all N prefixes
and the A prefixes from AA to AL
for Amateur radio operators. Canadians are typically VA or VE. Outside of
the USA amateur radio prefixes cover the alphabet. -- For example a station
in Argentina might be LU1AA. For radio prefixes of the world -- see URL:
http://ac6v.com/prefixes.htm

Contests are seldom gracious, objective is to contact as many other stations
as possible in a 48 hour period although stations can only be on the air for
36 of the 48 hours.

Hello Joel,
Just DO NOT use a modtransformer, bus a transistor as a modulator: take any transistor that can handle the current of the PA and use it as an emittorfollower... emittor to as powersupply to the PA, collector to the powersupply and the audio on the base; make sure via base-resistors (or additional extra transistors in the base) that you have half the supply voltage on the emittor so with modulation this emittorvoltage can swing between +- zero to supply voltage. Iused this principle about 30 years ago

Hello
I have a FT 920 with the AM filter and FM board. The FT 920 is 100
watts HF + 6 Meters.
It has a Auto tuner and the MC 100 Desk Mic. In the deal you will get
the technical supplement too (AKA Service manual), as well as the owners
manual . I also Have the 3 KW Roller Inductor Antenna Tuner. They are in
good shape I will trade both for a FT 990 or a FT 1000.. I have been
using the FT 920 as a backup rig. Drop me a line so we can work out a deal.
oris@dirtball.com
I have a Icom ICR71A Shortwave receiver that I will trade for a working
Viking Valant and SX 300 or Hamuland HQ 110. I'm looking for a good AM Han station
with at least 200 watts out. I hope to find something to work with my Audio rack.
I also have a Henry Amp 2 KD 5 Desktop,(It needs a new Plate amp meter) two 3-500s 100 in
will give you 1250 out, New Caps,
that I will trade for a Globe King or full legal output Ham band AM transmitter.
this is a pickup trade only. I will be willing to travel 100 miles from Athens GA.
Happy Holidays

Humm,
I've never seen an automatic distress alarm receiver (autoalarm) that couldn't copy pure CW. None of the ones I used or worked on, some of which dated to the late 1930's needed MCW. The autoalarm receivers were generally TRF units with a BFO or regenerative units with fixed feedback. They used a typical telephone type stepping relay to count the 4 second dashes that made up an auto alarm distress signal. When such receivers heard four 4 second dashes in succession, they rang the alarm bells.

The early autoalarm recievers didn't have AGC, so their gain had to be constantly fiddled with to reduce the effects of QRN.
Later autoalarm receivers used an AGC circuit that was based upon the time constant, not the signal level of the interfering signal or noise.

The longer the QRN or QRM lasted, the more the gain was reduced.
It's logical if you think about it....

I think another poster hit it when he said that many reserve receivers were crystal sets. That and the desire to have a distress signal be copied by virtually any receiver encouraged the use of MCW.

There was a time when AM broadcast stations near coastal areas were also required to monitor 500KHz for distress purposes.

During the annual ship's licensing inspections, the FCC's inspectors were adament about that MCW working correctly on 500KHz, right up to the end of the CW distress watch in 1999.

> Hallicrafters, looks like a receiver.

The military version of the Sx-73 (aka R-274) is the number that the government gave to those receivers. The other receiver made under that contract was the SP-600 (for the military's sake, it was also called the R-274.

Congrats on your D model - I've got one, too.

Found the manual on the
> Internet (thanks to Don Gilson, KC7YDB). It needed a line cord, so I
> put one on and fired it up. No 600 ohm speaker handy, so I hooked the
> phone out to my Mackie mixing board and listened thru the studio
> monitors (I'm a musician).

Do you have a line-voltage transformer? One of those with 70v line out? Those have several taps, and somewhere on there, you can put your 8ohm speaker to have it sound a little 'richer'. But I don't see a problem running the 600ohm output into the lo-Z port of your mixer channel.

Stuck a meter lead in the antenna jack.
> Lotsa crackling noise, no stations. Cleaned the pots and contacts on
> the monster turret assembly, and behold!!!! Pulling in all kindsa
> stuff.

That turrett is an ingenious device. I've often thought of building a TRF receiver, using something like that turrett design, and just switch to the different receivers I wanted to use, using the 'fingers' of the turrett for the common things, like voltages, tubes, etc built on a different chassis and mounting the two assemblies together.

Yesterday, had the day off, so I strung up 75' of #14 stranded
> Cu, hooked up a balun (hadn't bothered to put up an antenna since I
> moved 4 yrs ago) and drilled a hole thru the side of my house to the
> basement. This receiver is a killer!!!! I can't believe the stuff
> I'm pulling in.

Built like a battle-ship. Note how each compartment is localized and built to be shielded from the others. Hallicrafters shined on this receiver!

> BFO doesn't work, but I'm pretty sure I can get that
> going. There are two issues I have with this radio, however:

>
> Will aligning the I.F. fix this?

A good and general alignment with proper test equipment will bring that receiver a lot closer than what it is, now. You might want to adjust the BFO injection level on the back of the receiver. At the very least, clean that pot, also.

> 2. The frequency dial is off. I set it to WWV at 10MHz (loosened
> the setscrew and moved the dial), so the 7-14 MC band is pretty close,

>
> Will aligning the H.F. fix this?

The alignment process is in the manual, which is available at the Bama site.

> Other questions:
>
> 3. In the manual, a non-conductive screwdriver is recommended for
> adjusting the transformer slug inside adjustment. The outside
> adjustment is bigger than any fiberglass screwdriver I've ever seen.
> Is it OK to use a metal screwdriver for this, or do they make
> non-conductive tweaker with a 1/4"+ blade?

The "outside" adustment? I don't think there is on. That's probably how they mounted the coil onto the chassis. I wouldn't worry about trying to turn it. Doing so, if I'm thinking right, will serve to unwrap the coil wire and just, in general, screw up that can.

> 4. Voltage values are given for the signal to be injected into
> the IF and RF stages. Is this a p-p value, or RMS (avg)? My fluke
> 8060A won't work up to 455 KHz, let alone 54 MHz. I do, however, have
> a 200MHz scope.

Scopes work better (as far as I'm concerned) than meters. Just make sure the scope is in good working order.

> 5. I have a transformer on order from Antique Electronic Supply
> so I can use this radio with normal speakers (should sound pretty good
> thru a 4x12" Marshall cabinet!!!). In the meantime, will I damage the
> output transformer by not having a 600 ohm dummy load connected?

It don't care. Matching the impedance will help the sound, but I think there's enough swamping resistance on the 6V6 output stage of that receiver that it won't hurt it. The output stage is going to a transformer, as it is.

> 6. There's a 5kW AM broadcast tower about 1/2 mile from my house.
> Any insight on whether or not this will affect the alignment? It
> decreases to 270 watts after sundown, maybe it'd be best to do it at
> night.

When all the shielding is in place, and the receiver is operating properly and well GROUNDED, as long as it's not on the BC band, it won't hear that station.

> TIA for the help, I'm sure there's a vast well of knowledge on this
> group.

The R-274D is a hot receiver, when properly tuned and aligned and I've had lots of fun listening to cordless phone conversations on the 6m portion ;-)

Tuning off to the side of an FM repeater on 53.130, makes it sound nearly as good as an AM Broadcast station. I think that was a 'phase-modulation' radio that was transmitting, so it was easy enough to copy. Same for some of the 10m FM stations, but it's not -primarily- an FM receiver... those are just some hints for tuning in an FM station with an AM receiver. Old-er timers would refer to that as "slope-detection".

That's simply a damn fine receiver. I've had two at one time here. And, although I made 2.5 times the money on the silly thing, I'm -still- kicking myself in the ass for letting it go.

But, I've still got one here, and somewhere out in the shack, is the original TM.

Enjoy the best receiver made.

> HAVE NEW RCA 2E26 Tube that's for Gonset equipment like models II &
> III for 6 and 2 meters. $10.00 postage paided lower 48

a 2E26 is exactly 1/2 of a 6146, with all the same characteristics and voltage/grid requirements.

If someone were to want to drive an amplifier with something like a Ranger, replacing the 6146 with a 2E26, and unloading the final would make for some nice AM.

I wouldn't pay $10.oo for a 2E26, though... There's plenty of 'em around, and you can probably find 'em for .50c to $1.00 at a ham-fest.

Interesting. I was merely repeating information that came up when this
subject was discussed in the CW mailing list a while back. The info
came from an ex-op.

The bit about MCW used to avoid problems with zero-beat was from the
reminiscences of a U.S. shore station op - can't remember exactly
where I read it, possibly in "Morsum Magnificat", but it certainly
makes sense. I know some stations used 2 or more receivers tuned
to slightly different offsets on the 500KHz calling frequency for the
same reason.

A view of a WW2 liberty ship Radio Room can be seen here:

Source record: 35969

Hello...
I am in need of the following part for a Hammarlund HQ-145A (or similar model if the agc is the same one)
CLAROSTAT 10 (marked 4735-02-08000 140-6810) I guess that's the part number...
Audio Gain Control/AC Off switch.
Two terminals (for red/green and red/purple wires) on swicth and three terminals (for green, yellow, and capacitor) on AGC.
I am not sure if any ol' Hammarlund switch/AGC will work, but any experienced repairmen should know where I can get (or if I can get) a used or NOS replacement.
I may consider purchasing a "junker" parts HQ-145 depending on price.
Please email me with any source for Hammarlund parts (Used or NOS stuff), tubes, etc.
I am the second owner of this awesome DX radio since 1980 and would like to get it working and retubed, etc. for peak preformance. It's been well maintained, dry and relatively clean already... anyway...
A second rambling here... At one time, I noticed, many years ago, when turning the radio on, the 0B2 tube lit much brighter than normally. I replaced the 0B2 tube and the radio worked excellently after that.
Any thoughts on what might have happened? Was the tube itself bad, or was(is) there something wrong along the transformer that caused improper voltage to the tube?
Thanks to all for any help on loacting either a replacement switch/AGC or donar parts/junker rig.
I do not need the cabinet, as mine is dent free and only has some slight paint sloughing in areas. I MAY need a couple of knobs as a couple of the knobs are, at least for now, misplaced.

Steve,

Go to your nearest Radio Shack store, get the following part no. 271-1740 SPST Pot Switch. $.99. This is the switch that attaches to the rear of the potentiometer. Replace it, solder the wires in place and enjoy your HQ-145 again.

4602. BFO Injection Level in SP600

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-12-17 04:44:24 UTC
From: knudsenmj@aol.com.Oscar
Message-ID: <20021216234424.18530.00000082@mb-cm.aol.com>
Source record: 35975

Is there any real purprse, and adjustment technique, to the BFO Level pot on the rear of an SP-600? From everything I've heard, you watn as much BFO injection as possible, especially for SSB, but it can't hurt to have too much for CW either, can it?

Perhaps the adjustment is a tradeoff between getting good CW/SSB copy and not blowing too much BFO back into the AGC line? Though I think the SP600 keeps AGC on even with BFO -- just switches it to a Slower mode by cutting in an extra 0.25 uF cap.

Anyway, I just cranked mine all the way up. Any suggestions?
Thanks, Mike K. AA1UK

Source record: 35976

Thanks for the reply, Geoff. Been doing a lot of listening lately,
and am amazed at the stuff this big hunk o' metal will pull in.

The 'outside' adjustment on the IF transformers I was referring to is
the secondary. There are two concentric adjustments shown in the
alignment section of the manual (page 11 of the non-military version)
secondary adjustment. I guess I'll know if I need a non-ferrous
adjuster if I pull the screwdriver off and the reading changes.

Trying to track down an RF generator so I can do the adjustment. The
EMI guys at work have some, but they're really high-dollar units that
they don't want to let out of their hands. Don't blame 'em. In the
meantime, I guess I can do the 455 IF adjustment with the 2 MHZ
generator I already have.

Thanks again for the info.

George

Hi Mike
Each SP-600 is different when it comes to the ability of receiving SSB which it was never designed for.
However by adjusting the RF Gain down we are able to fine a good compromise between amount of
BFO injection VS signal overload. The AGC works great but can't keep up to the SSB changes.
This is what the external adapters come in . It's a balancing act.
Turning the BFO Injection up won't hurt anything as long as you like what you hear.
Enjoy the SP-600, it's a superb radio. 73 Chris VE3NGW/W4 Florida

I have for sale a very nice condition Drake R-4B receiver.
Works great and looks good. Pictures available by request.
Asking $250 shipped to continental USA.

Thanks,
Michael

4608. FS: 1950s HAM radio brochures, 100 new knobs etc etc CHEAP!

Hi:

I don't use this newsgroup so please EMAIL DIRECT to:
fireflite@westelcom.com

I cleaned out my uncle's basement, he was a Ham Operator way back in
the 50s and had these items, I know nothing about this stuff, but a
friend told me to post it here:

One small box of old 50s brochures, some of the names are National,
Hallicrafters, Hammarlund etc. all exc condition.SOLD AS ONE LOT ONLY.
$25.00 plus approx $5 shipping depending on location.

One large box of NEW 1950s knobs for radios , approx 100 of them, all
are new never used. Many many shapes & colors. SOLD AS ONE LOT
ONLY. $25.00 plus approx $5 shipping.

please EMAIL DIRECT to: fireflite@westelcom.com
thanks
Roger in NY

Maybe. EL84s are cheap and common and in current production, so it won't
hurt to swap it out. I'd first check for bad coupling capacitors, though.
A paper cap that has high leakage when it gets warm will cause the stage
after it to become badly misbiased.

> My family rode the big ferry across Lake Michigan to Milwaukee in the very late
> 40s, and my old brother claims to have snuck down in the engine room and seen
> the real thing (not some dull screaming turbine).

No doubt, and there were many smaller vessels using recips, including
the example Doug gave us. When I say "big recips", I am speaking of
commercial cargo vessels of around 16,000DWT & larger.

> Nice fresh lake water can go right into the boilers, no condenser needed, eh?

Not quite as nice as one might imagine - this simply saved distillate
consumption and condenser maintenance, but was offset by lower
operating efficiency & propulsion economy (i.e., by not exhausting
into a vacuum & by wasting condensate heat overboard). Fuel oil was
cheap when this was done.

> Yes, turbines were becoming standard even when the Titanic was built (she had
> one on the center screw).

The practical steam turbine well predates this, too.

There have also been many vessels utilizing a recip/turbine
combination, geared together.

> > The same
> >pragmatic priorities produced the famous turbo-electric tankers of the
> >era (T-2's), which could be operated just by controlling a big 3-phase
> >synchronous motor.

> Synchronous motor on a screw? How do you vary the speed?

During maneuvering, she is run non-synchronous (out of step) as an
induction motor. Also, three levers control the relationship of the 3
phases - throw any 2 of them, and she reverses. It is simple & fun to
operate, like a big 7,500HP toy, and the system was very reliable.
Today, the losses of the double energy conversion (steam->elect->mech)
as well as the higher HP requirements, makes such designs
uncompetitive.

> I always considered that a major advantage of recips -- ability to reverse
> instantly in an emergency. In the "Titanic" movie, they shut the engines at
> least partway down before shoving the links over, wasting precious time.

Much of this is speculative, and if there is one thing I learned in
years of marine crisis managment and disasters, it is that very often,

no one may ever know the complete truth of all that did - and did not - happen. The more time that passes, the more - not less - this truth comes to bear. I think we may all agree that the true causes of her misfortune were nothing marine-related, but were pride, greed, lust and arrogance. One way or another, these things are always fatal - whether on land or sea.

> >These all were DC ships, and the R/O had a substantial battery bank
> >for all the times that we would lose the plant.

> Must be hard to generate AC form an engine with such a wide speed range. You'd
> have MG sets where AC was absolutely necessary, right?

Neither AC nor DC were/are produced by the propulsion machinery for non-propulsion use aboard steam vessels (excepting the special case of T-2's that were later permanently moored & used as shoreside power sources). Turbogenerators have been the standard fare throughout both eras. Traditional S/S design has 3 TG sets, 2 sharing the load at sea & the 3rd shut down as standby - plus a small diesel genset located elsewhere (usually in a maindeck aft space) for emergency power & cold startup.

If you are interested in how big recips are built and operated and maintained, the authoritative real-world textbook, long out-of-print, is Practical Marine Engineering by Reno C. King. It covers the tripple-expansion Liberty types, the Skinner uniflow types, and others. This book was standard fare for freshmen at maritime academies until the late '60's, even before some of them chose engneering, and its basic knowledge is now largely forgotten "mystique." :-)

As I recall, BFO injection for CW is about 5-10% of what one might need for an equivalent SSB signal. Its also my understanding (and seems reasonably so) that too much BFO injection will cover up the "weak ones".

Mike Knudsen wrote:

4616. Ham gear for trade

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-12-17 22:15:38 UTC
From: Oris <orisnospam@dirtball.com>
Message-ID: <3DFFA17F.3020801@dirtball.com>
Source record: 35990

Hello
I have a FT 920 with the AM filter and FM board. The FT 920 is 100 watts HF + 6 Meters.
It has a Auto tuner and the MC 100 Desk Mic. In the deal you will get the technical supplement too (AKA Service manual), as well as the owners manual . I also Have the 3 KW Roller Inductor Antenna Tuner. They are in good shape I will trade both for a FT 990 or a FT 1000.. I have been using the FT 920 as a backup rig. Drop me a line so we can work out a deal.
oris@dirtball.com
I have a Icom ICR71A Shortwave receiver that I will trade for a working Viking Valant and SX 300 or Hamuland HQ 110. I'm looking for a good AM Ham station with at least 200 watts out. I hope to find something to work with my Audio rack.
I also have a Henry Amp 2 KD 5 Desktop,(It needs a new Plate amp meter) two 3-500s 100 in will give you 1250 out, New Caps, that I will trade for a Globe King or full legal output Ham band AM transmitter.
this is a pickup trade only. I will be willing to travel 100 miles from Athens GA.
Happy Holidays
73 and thanks for reading
Oris

What are they talking about on SSB?

Believe it or not, they're talking about YOU!

That's right, as soon as you tuned in, you triggered a secret device on their radios to tell them who and where you are (code numbers).

They share this info with others who check to see if you're hearing THEM too.

They guy heard by the most casual listeners wins and is given authority to raise his power to 100 kW, and to go "commercial" (sell airtime to religious groups, paramilitary organizxations, prophets of dooms, and otherwise disenfranchised fringe cases.)

Ok..got this on Ebay..(yea I know..: P)
On phone here is a "buzzsaw" sound. Does'nt happen on CW. I checked resistors..ok..Then there was arching at pins 2 and 3 of the 6l6. There was what appeared some carbon build up and cleaned that.
I changed the 6L6 and still the sound. Then something shorted at the 6L6 taking out the wires to the phone/cw switch, choke and another wire causing a minor fire. I replaced the wires and still the sound.
I changed to different high impedence mics with no change.
Any ideas or make a another denotion to the landfill?

Just one problem - no ads.

There are 5 or 6 other sites already in operation that get the bulk of
the ham ads:

http://www.qrz.com/cgi-bin/ikonboard.cgi?s=3e006329330fffff;act=SF;f=1

http://swap.qth.com/search.asp

http://www.eham.net/classifieds/

http://www.k1dwu.net/hamtrader/

http://www.dealamerica.com/deal/cgi-bin/ads/bcads.cgi?search_and_display_db_button=on&resu
lts_format=headlines&query=browse

There may be one or two others, but quite honestly, there is no need
for another ham radio classifieds site!

Check the voltages on the 6L6 and see what is up. You need to find out what
shorted, to begin with and you need to make sure the 6L6 is biased right.
If you saw arcing, I'd replace the whole damn socket just in case.

>Any ideas or make a another denotion to the landfill?

Hell, I'll take it. I haven't used one of those things since I was a novice.

Well,

Sounds like they were doing the Ten-ten exchange.

DZ5X would be a Philippines call sign, 23140 would be the 10X
number.

Sounds Kosher to me...

Of course all you were trying to do is troll anyway, right?

Well, greetings from the radio folks on board the RV Badtz Maru, which
was escorting the Brown for the wreath-laying ceremony.

The Brown's web site has some photos of the radio room and some contact
information for the guys maintaining it. I think most of it has been
restored and is operational (although their VHF set sounds like a modern
Furuno over the air).

I have one of these beasties, and want to fire it up. I have the schematic for the 29A, but my tube lineup is altogether different!

Does anyone know where I can download the schematic? I seem to have no B+, if the 29A schematic is correct.

Thanks in advance

4650. HQ-215 S meter

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-12-18 22:32:28 UTC
From: rrkrr <robert.kerr@gtri.gatech.nospam.edu>
Message-ID: <atqt1s$t4n$1@news-int.gatech.edu>
Source record: 36023

This is a stretch, but here goes.
I have a Hammarlund HQ-215 receiver with a non-functional S-meter. The coil is open. I have disassembled it and inspected it with a microscope, but evidently the failure is somewhere within the winding layers.

Do any of you Hammarlund fanatics have a trashed HQ-215 with a good meter?

4651. Many Many Radios

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-12-19 00:50:54 UTC
From: WF1U <WF1U@cox.net>
Message-ID: <OJ8M9.5266$I23.687965@news1.east.cox.net>
Source record: 36024

There are a lot of radios just collecting dust in Mass and RI seems that
these radios were once used by Hams
now they are just sitting there not being used in th TX position! These
Radios are all in great condition and the hams that own them have all
turned into SWLs and SandBaggers ! so If you make a contact on 10 meters in
the Mass or RI area adk them if they would like to get rid of there radios,
maybe a Nice Receiver from WalMart
for a trade seems they would even know the difference.
Pls dont reply just think about what I have said.

4658. FS: TWO GE PROGLINE TRANSCEIVERS-2 METERS

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-12-19 04:36:29 UTC
From: Don Pelrine <dpelrine@c4.net>
Message-ID: <3e0133cc.0@paperboy.c4.net>
Source record: 36027

FOR SALE:
Two GE Progline 2 meter transceivers. One Transciever has an AC Power Supply with a front GE front Control unit with the transmitter and receiver and also has been modified to use a GLB 400B Channelizer which allows you to operate the complete 2 meter band in 5KC steps without having to install the GE Oven Crystals each time you changed frequencies on the band. The Channelizer synthezizes the frequencies and and acts like a VFO for both the transmitter and the receiver. The Chanenelizer was bought new for $180.00 The GE tTransceiver is all vacuum tubes and the power supply is fused and operates from 115VAC and has a standard ac cord and plug. I have unlocked the case (2 keys included) and inspected the units and all are fine. The 3 units inside the case are labeled "Transmitter 4ET20A2, Receiver 4ER25CA, Power Supply 4EP2MI. There are also a spare transmitter and receiver that may be used for operation or parts. The Transmitter is labeled 4ET21A2 and the receiver chassis 4ER215B2. The sets installed operate at 30 watts and the spare set would provide up to 50 watts output. All the GE Prog Line documentation is complete for operation, specs. and servicing, update modifications etc. Same with the GLB400B Channelizer. Incuded is a GE P/T Mike that was made by Shure Brother's Model EM21A with heavy spiral cord and 4 prong Amphenol plug that inserts and locks into the bottom of the GE Control Unit of the transceiver. Also there is a complete antenna system 5/8 wavelength mounted on a strong magnetic base. Comes with 2 GE Speakers. All cabling is included. These vintage units were used by the Western Electric Company in their vehicles for mobile communications with Oven Crystals. I obtained the transceivers from a retired AT&T/WESTERN ELECTRIC/NYT transmission engineer. He is 97 years old and was with the bell system for 47 years. He is still and avid radio ham and operated this 2 meter rig equipment from his home and his family auto. the total weight for the rig including all I have mentioned above is 47 pounds(the documentation is 3 pounds). There are also some spare tubes.

The second GE Prog Line is an ERG56TA566 ET-4A ER-48A black rugged metal transceiver for mobile operation with all the cabling and GE Volume -Monitor contol unit that uses transistors and just a few vacuum tubes. Comes with a coupole of antenna bumper mounts and springs with all the hardware for mounting and installing in a vehicle. The documentation is complete with it. I have also opened this unit--has lock but has been disabled and found all in order and clean. There are 24 GE Oven Crystals for 2 meter operation all in excellent condition. All this gear weighs an additional 46 pounds.
We are talking real boatanchor here. Both Tranceivers are excellent specimens. Would have to send all in 2 separate shipments. Estimate each package at 50 pounds. Have pictures. Will consider any reasonable offer. Have pictures if desired. Please email me to dpelrine@c4.net. Thanks and 73s, Don WA1TVH

I think the alcohol dries too fast for good cleaning and rinsing.
I like to really hose things down to get into all the nooks and crannies
that are inaccessible by a brush and plain old soap (like dish
detergent) and water does a pretty good job. Be careful with miracle
cleaners like 409/Fantastik or Windex. Although they clean well they
can leave a front panel splotchy looking if the cleaning isn't evenly
done. But the smoker residue will rinse right off...very little, if
any, brushing required.

I *used* to like "Scrubbing bubbles."
It sure cleaned that black wrinkle well.
Now, 3-4 years later, the items cleaned with it have
green corrosion under the brass screws and under the
nomenclature plates. If you're going to use these kinds
of products, you *must* disassemble, clean, then throughly
rinse with distilled water. Dry well.
Be careful with any cleaning chemicals.
Products that look like simple soap can have additives
that will cause you grief a couple of years down the line.

One product *not* to use is "409". It etches aluminum
and can fog glass. I have had good luck with De-solv-it
Citrus Solution cleaning an old plastic cased Triplett VTVM.

409 will take it off very nicely. Watch out, though, because 409 will
etch phenolic plastics like Bakelite too.

On painted surfaces like front panels and cabinets I've had outstanding success using Goop or similar smooth cream hand cleaners. Melts it right off. I've used it on wrinkle finishes also.
However, no matter what you use, try it in a small inconspicuous area to see what happens before jumping in all the way.

Hello
I have a FT 920 with the AM filter and FM board. The FT 920 is 100
watts HF + 6 Meters.
It has a Auto tuner and the MC 100 Desk Mic. In the deal you will get
the technical supplement too (AKA Service manual), as well as the owners
manual . I also Have the 3 KW Roller Inductor Antenna Tuner. They are in
good shape I will trade both for a FT 990 or a FT 1000.. I have been
using the FT 920 as a backup rig. Drop me a line so we can work out a deal.
oris@dirtball.com
I have a Icom ICR71A Shortwave receiver that I will trade for a working
Viking Valant and SX 300 or Hamuland HQ 110. I'm looking for a good AM
Han station
with at least 200 watts out. I hope to find something to work with my
Audio rack.
I also have a Henry Amp 2 KD 5 Desktop,(It needs a new Plate amp meter)
two 3-500s 100 in will give you 1250 out, New Caps, that I will trade
for a Globe King or full legal output Ham band AM transmitter. this is a
pickup trade only. I will be willing to travel 100 miles from Athens GA.
Happy Holidays
73 and thanks for reading

I use regular household sudsy ammonia from the grocery store with a small paintbrush, blot up the surface with paper towels as you go. The gook just runs off and doesn't seem to harm anything. I guess you could water rinse afterward, but I have not found that to be necessary.

<< I have a Icom ICR71A Shortwave receiver that I will trade for a working Viking Valant and SX 300 or Hamuland HQ 110. I'm looking for a good AM Han station with at least 200 watts out. I hope to find something to work with my Audio rack. >>

You won't get 200 Watts out of a Valient. I think it is less than 90 Watts INPUT power, so maybe 60 Watts out.

Don

RE:
<< Just acquired a 51S-1. A lot of audio distortion apparent. Possible overloading? Turning down RF gain removes the distortion. Only apparent in AM. Also 'S' meter not working - could this indicate an AGC problem? All help appreciated. Thanks. >>

It certainly sounds like there is no or low AGC, but I couldn't locate a schematic to look it over.

That's kind of like asking "does anybody have a Mustang Shelby with a motor that they would like to part out?"
Actually, it might not be to bad to replace the meter movement. All you would need is some of that flourescent orange paint to redo the pointer with. You can find that kind of paint at hobby shops. I have been able to successfully repair meters in this manner. Good luck!

Pete

Gosh! I may have to git a 'modrun' rig!
Gigahertz! I don't think I could put together all my spare 6W4 triodes
to get a harmonic that high. I'd need a coil and... the tuning caps must be
eency-weency, teeny-weeny.
Hey, must be on a chip. Two million on a postage stamp must be
small enuff.
I hope there's a nice looking rig. I'll search eBay. I don't want no pocket
size Yachtboy stuff.
? No wonder they're selling 100Kh-30Mh audio filters and active antennas
so cheap?

> INPUT power, so maybe 60 Watts out.

The Viking Ranger uses a single 6146 with somewhere around 700v @ 110mA modulated by a pair of 1614's (Ranger I for the 'officials' ;->) for 75w or so DC Input... around 45 to 50 out.

The Viking II used a pair of 6146's, at 220mA modulated by a pair of 807's, and runs 90 to 100w out all day long.

The Viking Valiant runs (3) 6146's @ 330mA, modulated by a pair. That's more than 90w Input power...

Perhaps you're thinking of a Navigator?

Hello
I have a FT 920 with the AM filter and FM board. The FT 920 is 100 watts HF + 6 Meters. It has a Auto tuner and the MC 100 Desk Mic. In the deal you will get the technical supplement too (AKA Service manual), as well as the owners manual. I also Have the 3 kW Roller Inductor Antenna Tuner. They are in good shape I will trade both for a FT 990 or a FT 1000. I have been using the FT 920 as a backup rig. Drop me a line so we can work out a deal.
oris@dirtball.com
I have a Icom ICR71A Shortwave receiver that I will trade for a working DX 100 and SX 300 or Hamuland HQ 110. I'm looking for a good AM Ham station with at least 100 watts out. I hope to find something to work with my Audio rack.
I also have a Henry Amp 2 KD 5 Desktop, (It needs a new Plate amp meter) two 3-500s 100 in will give you 1250 out, New Caps, that I will trade for a Globe King or full legal output Ham band AM transmitter. this is a pickup trade only. I will be willing to travel 100 miles from Athens GA.
I also have a Hallicrafters S 38 C Shortwave receiver. Its in great shape. It works but I have no idea what its worth. It is a old old receiver. (Make Offer) I have a MFJ Versa Tuner II and a Roadtalker 40-channel sideband CB radio that somebody converted to 10 meters. It works quite well. I talked to a guy in South America on it. (Make Offer)
I also have a CBS 1000 transceiver. 25 MHz to 29.795 MHz. In 10 kHz steps. I got it at a hamfest in Georgia. I'll trade it for a SX 300 or NC 300 HQ 110 HQ 170 HQ 200 or similar HF receiver.
Happy Holidays

Well Orfis your gonna have to modify it a bit to get it to splatter like your like. You will need to bypass the interstage audio transformer. Probably use some large caps and go around it.

Then you will need to take out all those .5 caps and replace them with say about .01. That will widden it right out there like you like it.

Williams posted, in part:
<< Thanx for the tip! I got distorto on my 'new' Lafayette He-10 at hi AF and/or IF gain. Sounds just like an agc. >>

I bought a HE-10 not long ago on eBay and found one of the spring-metal clips that hold the tubes down, was wrapped around a component wire at a tube socket and messed up the AGC and audio level. Look at all of them before you do much more trouble shooting.

I'm surprised at how good the HE-10 is. I bought it as a foundation for some serious playtime upgrades, but it's at least a 9 on a scale of 1-10 and I'm reluctant to mess up what might be a good collector rcvr. Good luck with yours.

I'm looking for a pair of Swan twins -- 600T/600R, a Swan 400, and a nice 700cx. I'm also looking for a working Drake TR4C or a pair of Drake C-Line twins. If you have any of these and would like to part with it, please email me at jcamp2@cox.net. I can offer cash or a swap for a combination of the following items:

Heathkit HW-104 80-10M solid state transceiver with speaker, PS, operating and
construction manuals, excellent condition.

Kenwood TS-830S 160-10M transceiver in good condition (includes WARC bands) and hand mic, copy of manual.

MFJ 1270C TNC with original box, cables, manuals (I'm the original owner).

Alinco DR-1200T 2 meter data radio with cable and manual. Cable is for the MFJ 1270C.

AEA PK-232 TNC. Original box, manual, tons of cables.

That big, complicated, two dollar word you're struggling with there is "WIDEN".

But, it's not hard to tell that you'd have a problem with a word so simple.

I don't know what the problem is between you and Oris, but as far as I can tell, he's only come on here posting a legitimate request and all I've seen from you have been slander, insults and innuendos questioning Oris' lack of intelligence.

I gotta tell ya, I'm not impressed.

>But, doesn't your 129X have some modificaations?

It's been modified to accept the Q multiplier, it plugs into the dc power socket on the back. A phono plug was added to the back of the chassis to connect to the 455kcIF of radio to the multipler.

A 100kc/ 1000kc calibrator has been added to the radio also, it's on the chassis behind the IF can in the rear corner...and the 6K8 converter tube had been changed also, to a miniature 9 pin 6X8.

**A three position panel switch was added in the bottom left hand corner to turn the calibrator on and switch between the 100 or 1000kc position. That's it, could the addition of these things make THAT much of a difference?? Inquiring minds want to know. I love my 129X.....I just wish the 140X was as good, not to say it's a dog...but ;-)

4709. Philips PM3212 scope repair.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-12-20 12:03:55 UTC
From: Brian Donaldson <bdonal@mweb.co.za>
Message-ID: <3e030ab7.0@news1.mweb.co.za>
Source record: 35883
Cross-posted to: sci.electronics.repair,rec.radio.amateur.boatanchors

Hi all,

2 problems with my Philips PM3212 that I am trying to repair. I have been working on it for days, but with no schematic I haven't had any luck so far.

1) The timebase works OK at powerup. Once warm the sweep no longer occurs (only a dot at left side of screen). There is no sweep regardless of trigger or time/div settings. Any ideas on where I should look?

2) Stupid Stupid Mistake! I probed on the 2 yellow high voltage caps at back of main PCB. (these are connected to the grey and blue wires to CRT). Needless to say, I blasted my cheap DMM, and the intensity control on the scope no longer works. The trace is now always far too bright - the retrace is also slightly visible. The focus still works OK. Any ideas?

Any help or hints fron a schematic would be most appreciated.

Brian

4711. Tektronix 2235 PSU repair

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-12-20 12:27:44 UTC
From: Brian Donaldson <bdonal@mweb.co.za>
Message-ID: <3e030be1.0@news1.mweb.co.za>
Source record: 35884

Hi all,

Both my scopes are not working, so I am trying to get them servicable
again.

My Tek 2235 has a PSU problem. It blows the fuse on powerup. I have
stripped the unit down, and nothing appears burnt. Without a schematic I
am
not sure which devices to look at first. Any ideas, or even better a copy
of the schematic (PSU section), would be most appreciated. (the PSU may be
similar to the other 2200 series scopes)

regards,
Brian

This is a great receiver. I use mine mostly for ham use on AM. The
audio is good and the receiver is built like a tank!!!! Its HEAVY.
Keep in mind that the audio output is 600 ohm so youll need a 600 ohm
speaker or 600 to 8 ohm transformer.
Bill

I didn't hold out much hope, but thought I'd try anyway. My HQ-215 meter movement is mounted into the magnet frame by peened crimp mechanical connections. It will require some careful, precision work with a milling machine to get the movement out and even more careful work to rewind it. However, this seems to be the only way to do it, as I have been looking for a long time and have not found another meter movement that can be made to fit inside the original case.

Carl Strode <crstrode@webbworks.com> wrote in message
news:<3E014C3D.2744C817@webbworks.com>...
> What is the best way to remove smoker residue from my old radios?

Depends upon what "old radios" means, and what state they are in. If they are BA gear, I find it much faster, more effective and cleaner to remove ALL readily-soluable residues by washing/brushing the entire set outdoors with a dish-soap/ammonia solution (which of course is all free-rinsing), and a real hose with a lot of rinsewater. Resonable judgement in pointing the hose, and a long period of sun-drying or indoor dehydrating, cleans the whole works with no hard work and no damage, and leaves no residues to frig things up later. This also makes the set much easier to work on. I hardly ever frig with various cleaners anymore, except for problems that real soap & ammonia won't dissolve.

And since I smoke myself, I reclean my "keepers" every few years the same way.

The HE10/KT200 was never intended for SSB reception, and lacks
a product detector. You will HAVE to manually ride the RF/IF gain
controls to obtain the correct BFO to signal ratio for the radio to
work in that mode.

It is just a single-conversion, older-design radio in the BC band, and performs like any other radio of the same sensitivity, selectivity & s/n ratio, in terms of hauling things in - if this is all we are focussing upon. Maybe if one were to operate 2 or more of then in space diversity - with the land & antennas to do so - one might obtain some DX advantage (in terms of fading only) over any other radio (tube or SS) of similar specs. Beyond this, any BA radio would seem to be inferior in this aspect compared with almost any modern, state-of-the-art offering. We are not talking about how it sounds, how cool it looks, nor how much fun it is to operate.

it's a plate transformer - UTC PA-301.
110v in - two sections out - center-tapped secondary.

What I'm interested in, is the current capability of this beast.

Plans are to use the Hi-voltage output for the modulator choke-input
power supply, and the low-voltage output for the Plate B+ supply (for
closer matching of impedances)

The plan is, to series the two power supply outputs so that the final
gets around 1600VDC @ 300mA (480wDC Input from a pair of 250TH's)
and around 2400 to 2500VDC for the modulators (also a pair of 250TH's.)

What I need to know, is if the UTC PA-301 plate transformer is capable of
around 400 to 500mA continuous.

So, you get a magnetron out of a microwave oven. You need a better power supply than the oven provides unless you want lots of 60 Hz bandsplatter crap, but you can use the same transformer. Relay key the B+ and you have a really nice CW rig that can be shifted a few MHz into the ham band.

It's possible to do AM with these using plate modulation but there is a lot of residual FM. I am told that they can be FM modulated but I have not tried.

Nope, tubes are the order of the day for microwave work. They are just very different tubes.

If you want receiving stuff up that high, the Icom R-100 is a nice start.

That depends what model it's in, what condition it's in, and whether the
intervalometer is there. It also depends on what lens is fitted on it.

Older aerial cameras are generally not worth much (except for smaller
ones like the Fairchild K-3), but the lenses and shutters on them can
be worth a lot since they can be used for large format pictorial work.

I bought a K-22 camera cone from G&G Radio (Lynn, Mass?) many years ago.
It didn't have any of the electronic bits but the lens was an Aero-Ektar
4-inch f/6 and I made a decent astronomical telescope out of it. Good
only for low powers but just fine for "rich field" viewing. I think I paid
25 $ for the cone (with lens) and carrying case back in mid- to late-60's. I
still have it.

>>
>>Don

A Viking Valiant has an input power 275 Watts CW and 200 Watts AM
Efficiency of the final is typically 65%

Therefore you can get an output power on the order of 180 Watts on CW.

130 Watts AM.

In reality you can actually squeeze a little more than that if you
push it.

HOW could you think that THREE 6146s would each produce
only 20 watts out a piece? That is a very questionable idea!

Here are the Valiant specifications on-line:
http://www.qsl.net/la5ki/org/vi/vi.htm

Read the Johnson manual if you are unsure. Maybe you were thinking of
another model like the Adventurer?

(and a most GRAND AM rig it be!!)

Hi folks,
I just picked up an old radio at a local thrift shop for *free*! Here is a picture of it on my bench:

http://www.qsl.net/kc7bum/MVC-367S.JPG

I did some poking around on the net and it appears to be an Allied Radio Knight R-100. Am I correct? There are no identifying numbers on the outside. The only visable difference between mine and the one I saw on the net is that mine has the white logo KNIGHT where another dial or SWR meter should be. It appears to be in fairly good shape, albeit incredibly dusty. Seems to be fully functional too, from what I could tell with a quick bench test. The external speaker (not shown in my photo) has a couple of punctures in the front grill.

Am I correct this is a Knight R-100? Was it sold as a kit? What years were these things sold? I've never restored an old radio before, so I don't know what I'm up against. Be nice to clean it up like new.

Any help or suggestions would be appreciated.

Nah, I want to keep it.
This particular problem exists on any band selected. Its pretty
weird...if I pull the second 6AQ5 it will start to die off slowly over a
period of several seconds but won't go away completely.
I'm going to try some different chokes, etc and see if I can tame it.

>dial or SWR meter should be.

I haven't logged back on to check your Web photo, but from your description I'd say yes, you have a Knight R-100. The rightmost of the three openings held the *optional* S-meter. When I built one as my first Ham receiver in 1960, I was too cheap to buy the S-meter for an extra $10 (the radio kit was $100 even, a real bargain then, compared with $150 for an SX-99).

Many years later I found another R-100 at a ham fest with the S-meter ,and grabbed it.

>Am I correct this is a Knight R-100? Was it sold as a kit? What
>years were these things sold? I've never restored an old radio
>before, so I don't know what I'm up against. Be nice to clean it up
>like new.

Yes, this radio was sold only in kit form. With its two PC boards and unique PC band switch, it was fairly easy to build, even with 9 tubes, half of those being dual-function. The RF front end section tubes sit haflway below deck, looking very high-tech.

This is a very fine radio, eletrically speaking, for a single-conversion set. It's equivlanet to a Hammarlund of that vintage, except it is "hotter" on the higher bands due to the more modern tubes. Physically, it's a bit flimsy, and mechanically the tuning feel of the planetary verniers is not as good as the cheapest Hammarlund. Warm-up drift is pretty fierce. I learned to turn mine on before supper if I planned to operate after dinner! Audio output is powerful, but a bit bassy.

The Q multiplier can be switched to either peak (for CW) or reject (to kill heterodyne whistles on AM and SSB). Many sets of this era featured Q multipliers.

If both your tunign knobs work smoothly without backlash, and you bandswitch cleanly selects all four bands, you have a good R-100. Do clean it up and align it.

It was made about 1959 into the early 60s. A later R-100A model was identical but with less attractive cabinet. Enjoy the set -- Mike K. AA1UK ex K3JVK

I hope that you are able to find something that works. That was a pretty cool receiver. I think that it was the only receiver that Hammurlund made, that had a Mechanical Filter in the I.F. strip. About the only problem that I ever ran into was some cross-modulation on the 49M band in the evenings. I think that it could probably be updated with a higher level mixer.

Pete

Hello
I have a FT 920 with the AM filter and FM board. The FT 920 is 100 watts HF + 6 Meters. It has a Auto tuner and the MC 100 Desk Mic. In the deal you will get the technical supplement too (AKA Service manual), as well as the owners manual. I also Have the 3 kW Roller Inductor Antenna Tuner. They are in good shape I will trade both for a FT 990 or a FT 1000. I have been using the FT 920 as a backup rig. Drop me a line so we can work out a deal.
oris@dirtball.com
I have a Icom ICR71A Shortwave receiver that I will trade for a working DX 100 and SX 300 or Hamuland HQ 110. I'm looking for a good AM Ham station. I will trade this Receiver for a good working AM station. I want both transmitter and receiver. I want the transmitter to have at least 100 watts out. I hope to find something to work with my Audio rack. I also have a Henry Amp 2 KD 5 Desktop, (It needs a new Plate amp meter) two 3-500s 100 in will give you 1250 out, New Caps, that I will trade for a Globe King or full legal output Ham band AM transmitter. this is a pickup trade only. I will be willing to travel 100 miles from Athens GA. I also have a Hallicrafters S 38 C Shortwave receiver. Its in great shape. It works but I have no idea what its worth. It is a old old receiver. (Make Offer) I have a MFJ Versa Tuner II and a Roadtalker 40-channel sideband CB radio that somebody converted to 10 meters. It works quite well. I talked to a guy in South America on it. (Make Offer) I also have a CBS 1000 transceiver. 25 MHz to 29.795 MHz. In 10 kHz steps. I got it at a hamfest in Georgia. I'll trade it for a SX 300 or NC 300 HQ 110 HQ 170 HQ 200 or similar HF receiver.
Happy Holidays

I've not seen (to my knowledge) a Harvey-Wells Bandmaster,
but with any output stage, I would think the first thing to do,
would be to put some parasitic chokes in the plate leads, at the
tubes' plate connection, as well as the grid connection

It doesn't have to be much - like maybe 100 ohm 2-Watt resister
with about 5 or 6 turns of self-supporting (read: stiff) wire

Hello
I have a Kenwood TM-2530A that I used as a 2 meter packet station. It needs a Mic and the light that lights up the liquid quartz dial. The radio works fine and is in good shape. I looking for a good AM transmitter.
I have a Kenwood TR 7850 This radio I used as the BBS access on 2 meters. It needs a Mic and needs a new lithium battery backup. I turn the radio off and back on it forgets where it was and defaults to 144.000Mhz. Other than that the radio works fine. I want a working AM transmitter.
I have a Kenwood TM 201a. I used this 2 meter radio as sat transmitter. I worked Mirror before it came down. It Needs allot of work. It needs a dial. The Freq. read out is all screwed up. This is a fixerupper. It receives fine and transmits fine. It needs a mic too I will though this in too with either one of the above 2 meter rigs
I have a Versa Tuner II 949c and a Palomar PT 340 tuner tuner that I would through in too with either one of the above 2 meter rigs. I also Have a Kenwood KDC 1011 mobile CD player that has the plugs set up for a the older fords. I will through it in too with either one of the above 2 meter rigs.
I also have a Behringer Ultra Graph Pro GEQ 3102 31 band equalizer that I will through it in too with either one of the above 2 meter rigs.
Hey thanks for reading
Happy Holidays

4768. WTD: 51J or R388 tuning gears/junker/info

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-12-22 17:30:47 UTC
From: Jack Leishman <k8xx@gtii.com>
Message-ID: <v0btkkfded4aee@corp.supernews.com>
Source record: 35941

Hi, I recently bought a 51J-2 on Ebay for $242.50, however it needs a couple of gears that may be a nightmare to repalace. I see the two that appear to be bad, but have not attemped to remove them. Because they have slipped, the timing is way off on the bandswitching. Maybe a complete tuning mechanism from either receiver is the best bet. I believe they are the same mechanisms. The gears in question are the smallest and the one it is geared to on the front side of the gear assembly that moves around a larger gear as the bandswitch is moved. It is the only gear that flys around a larger gear. If anyone can help with parts or info, I would greatly appreciate any help possible. I would be interested in a junker for the proper parts. I'm going to make this a winter project if I can find the parts, as the rest of the radio is in great restorable shape. Thanks!

Thanks, Mike. Not sure what I'm going to do with this R-100, except clean it up for the time being. Someone else mentioned replacing the caps throughout. At least it looks nice on my bench along side my other gear. I've never DX'd with old receivers before. I'm of the newer generation and I cut my teeth on a Kenwood R-2000. It has probably spoiled me a great deal. Also at the same thrift store I picked up an Aircastle 16F1H receiver from the same time period. The rabbit ears have been snapped off, and the pots need a good shot of something to clean them up.

Looks like I'll be busy for a while.

Anybody know anything about the Aircastle 16F1H receiver? I just picked one up in a thrift store. Looks like it is from the 1960s. The rabbit ears are snapped off, and the pots need a good shot of something to clean them up. Unsure whether I should try to restore it to like new condition, or to just get it functional for mine own needs. I've been wanting a portable SW receiver, and this may do the trick.

In the very early days of steam, with maybe 25 PSI from the boiler, the engines would barely turn over without the condenser pulling an extra 10 PSI vacuum. I wonder how Diesel fuel costs today compare with bunker oil for a steam plant?

>> Synchronous motor on a screw? How do you vary the speed?
>During maneuvering, she is run non-synchronous (out of step) as an

In an emergency, would those two reversing switches be thrown just like that, at full speed? Just like throwing the links on a recip, only even more instantaneous :-) Might risk tripping a breaker or other protection?

>Today, the losses of the double energy conversion (steam->elect->mech)
>as well as the higher HP requirements, makes such designs
>uncompetitive.

ISTR hearing that the next generation of DD destroyers will use electric drive from the gas-turbine engines. Current DDG class just hard-gears the turbines to the props, and depends on variable-pitch prop blades for speed and reverse.

>Much of this is speculative, and if there is one thing I learned in

No argument there. It's amazing how far she made it into the ice field before the big scrape.

>Neither AC nor DC were/are produced by the propulsion machinery for
>non-propulsion use aboard steam vessels

Makes sense. Again I'm remembering a well-filmed old movie, "The Wreck of the Mary Deare", with great action scens in the boiler and engine rooms (and a view into the brunt-out radio shack, just to stay on topic :-) When the salvage engineer starts up the big recip, the lights come on, dimly at first, as if generated from the engine.

>If you are interested in how big recips are built and operated and
>maintained, the authoritative real-world textbook, long out-of-print,
>is Practical Marine Engineering by Reno C. King.

Our Maine Maritime Museum has many steam books in its library archives. I helped sort them out once. Now I know a good one to look for, thanks.

They may have some stuff on marine radio gear and practice, too.

Jeff,

Already went googling last night and found the reference you mention. That's why I approached the list as a last resort. I was *hoping* someone would know a little more background on this unit and maybe even have a manual they could copy for me. :-)

As to the Columbia River gorge, it's incredibally beautiful in the spring and summer, but right now it's a cold, foggy, rainy, windy, muddy mess. Who can deny the beauty of the Multnomah Falls, though? It's just a 15 minute drive from my house. Great place to live and raise kids.

Rob

I've had good luck with Fantastik spray cleaner (check on an unobtrusive section first--if it doesn't lift any paint, you can spray it on--tobacco residue will usually flow right off). For stubborn areas, try SoftScrub, a mildly abrasive cleaner (I think Vim is virtually the same). Go gently and don't be surprised if a bit of the surface of the paint--the old oxidized stuff--comes off too. When done with either product, rinse well. For a final shine, especially on wrinkle finishes, spray with Armorall, let dry and buff.

I know your transmitter needs a good home fast, hence the "popular price"! I have a GE BTC-1000 (currently working on 1570 kHz, pair 4-250As modulated by another pair 4-250-As (excellent condition inside and out, small footprint, runs off 230 volts, single-phase--no special power needed) that I might decide to part with in the coming months. Any idea what might be a fair asking price?

4783. Re: Ships Radio Room Clocks

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-12-23 02:42:01 UTC
From: Doug <dslosty@pipeline.com>
Message-ID: <jfsc0vooc9p73f74o8std8js82rkte7rdh@4ax.com>
Source record: 35706

To comment on a couple of topics mentioned below:

Many diesel ships use bunker C fuel while at full sea speed but switch to marine diesel fuel during manuevering or other slow speed running.

For maximum efficiency, many diesel ships use a waste heat boiler, running off the stack gases while at full sea speed, switching to a separate oil fired boiler for domestic needs and fuel pre-heating while in port or manuevering.

Several of the newest cruise ships are diesel/electric propulsion. It seems to be efficient enough for them despite the double energy conversion.

I sailed on 2 different T2 tankers with the turbo/electric propulsion. They had to have a large crew since the engine room was totally non-automated. There were oilers stationed at each boiler constantly adjusting the burner levels - a miserable job in the tropics.

Of course these ships were miserable in general since they had been converted to liquified sulphur tankers. I was aboard them from 1979 to around 1983 - on and off during several assignments.

One was the S/S Marine Texan, sister ship to the Marine Sulphur Queen that vanished with all hands around 1963 and added more speculation about the Bermuda triangle.

On the Marine Texan, most of the equipment was vintage 1944.
The radars were the 1948 RCA 12 inch displays. The radar transmitter had banks of 2D21 thyratrons developing the range rings, and range timing.

The RDF was the original with a dynamotor supply. The Radio room console was the original RCA 4U console with an added Mackay 2020 receiver and a newer auto alarm.

There was an original 1948 RCA Loran A, with the CRT used to align the two signal pedistals by mechanical counters.

The Sperry Gyroscope used what I liked to call the "wagon spring" voltage regulator that was used to create a constant voltage for the repeaters. The regulator consisted of a large leaf spring, reverse loaded by a large solenoid, pushing down upon a carbon pile.

The ship was still a DC ship but had a motor generator unit added for limited AC, including AC for my radio room.
The emergency batteries were charged thru banks of high wattage resistors direclty off of the DC power line.

Air conditioning had been added but it was pretty ineffective. It was
of the chilled water type where cold water was passed thru coils in
each room with a little phonograph motor like fan operating behind the
coils. It was mainly useful for breeding cockroaches....

We were running from Mexico to Tampa.
I used to cook myself in the radio room each time I tried to charge
the emergency batteries since those dropping resistors put out a
hellish amount of heat.

The sulphur was kept molten in steam heated tanks. There were vapor
vents shaped like huge snorkels rising from the tanks. At night, under
lights you could see the perpetual yellow haze rising from the ship
with the sulphur constantly fuming in the tanks.

The other converted T2 sulphur carrier that I worked on was aptly
named the S/S Louisiana Brimstone....

Due to the sulphur fumes, keeping any electronic equipment going was a
constant challenge. Switch contacts corroded constantly, copper turned
black within days, pots wouldn't work, etc.

You remember a great deal. :-)

> Several of the newest cruise ships are diesel/electric propulsion. It
> seems to be efficient enough for them despite the double energy
> conversion.

The passenger trade's economics differ from cargo trades; voyage legs
are relatively short (i.e., less efficiency required for the
steady-state sailing legs) and with many dockages (potentially high
repetitive pilotage & towage costs, and much out-of-service time as
a proportion of the voyage). By means of a higher capability of
unassisted maneuverability, usually also enhanced by an electric bow
thruster, towing & pilotage costs are reduced. Also, hotel services
consume a far higher proportion of her fuel versus main propulsion
requirements, further reducing the significance of conversion losses.
these head, but don't complete, the list of justifications for
diesel-electric plants in such service.

> I sailed on 2 different T2 tankers with the turbo/electric propulsion.
> They had to have a large crew since the engine room was totally
> non-automated. There were oilers stationed at each boiler constantly
> adjusting the burner levels - a miserable job in the tropics.

Humorously but truthfully, this was not so. These vessels were very
well automated when new, and with reliably designed pneumatics to
boot. there are 2 reasons why we saw the results you describe in
American flagged fleets:

1) No one properly maintained the control systems (American seamen
were notoriously lazy & overpaid, many were not trained in the
operation & maintenance of these control systems, Owners were lax or
too cheap to buy spares, and profit margins due to cheap fuel &
governement propups were high);

2) Union crewing demands/requirements. Let us remember that the only
crewmember who could be selected by the company or held directly
accountable to it in a meanigful way, was the Captain.

Throughout the '70's, by contrast, T-2 conversions (i.e., same
engineroom) were safely, efficiently and profitably operated with 2
men on watch, and they worked while on watch too (such as my former
German crews).

And we are only talking a 7,500 SHP ship here.

> Of course these ships were miserable in general since they had been
> converted to liquified sulphur tankers. I was aboard them from 1979 to
> around 1983 - on and off during several assignments.

You were brave.

The first vessel built keel-up as a chemical parcel tanker, which spawned a whole industry, was a T-2 with a jumboized midbody, using the original foreship and afterbody. She was the S/S Alchemist - the first vessel I managed. If you think sulphur was fun, try propylene oxide carried only under relief valves. :-) Or phenol, which dissolves flesh before it kills in a gruesome death. Not to be daunted, our German crews expertly and jovially operated these vessels, sometimes at high levels of personal risk or sacrifice, with 500 cases of Holsten beer per 60-day voyage<BG>. I always felt that the ideal naviation aid, in those days of bad Loran and limited Omega, would have been a bottle detector. Later, we learned that a little alcohol in one's bloodstream greatly increases the absorbtion of dangerous chemicals. There were many tragic and challenging lessons learned while pioneering bulk chemical carriage.

> One was the S/S Marine Texan, sister ship to the Marine Sulphur Queen
> that vanished with all hands around 1963 and added more speculation
> about the Bermuda triangle.

Her Master, Capt. Fanning, was the father of my closest boyhood friend, whom I met when they were still grieving. Due to the unsolved aspects of her loss, it took years for the family to be compensated. According to firsthand account, when Capt. Fanning would come home after a long voyage, he would throw a roll of quarters out over the lawn for his 2 children, proclaiming that as soon as they found them all, they could come inside. He always left a few missing to delay them, while he was inside doing what all good seaman do first. :-)

> The ship was still a DC ship but had a motor generator unit added for

Typical of most of the postwar & older MSTS tonnage re-registered for commercial service of the era.

> Air conditioning had been added but it was pretty ineffective. It was
> of the chilled water type where cold water was passed thru coils in
> each room with a little phonograph motor like fan operating behind the

The A/C was originally fitted to most of them, but was never effective, was often modded or re-engineered (which usually wasn't much better for long). This was even worse aboard the C-2's & C-3's. The main thing that chiller rooms bred was rust, but I always marvelled that NMU cooks never came up with a recipie for

cockroaches. :-)

> Due to the sulphur fumes, keeping any electronic equipment going was a
> constant challenge. Switch contacts corroded constantly, copper turned

What a bitch - I wonder if any of us have had problematic gear due to its former particular conditions of service afloat (cargo vapors, or other)?

<don'tspamme-exray@caribe.net> writes:

>There was a Knight R-55....the cheaper one at the time.

Yes, the R-55 was cheaper, and actually a later addition to the Allied catalog.
I think it cost $55, hence the model number :-) (Lots of mfgrs did that).

According to Osterman's book, the R-100 came out a year earlier under a rather
clunky catalog number "Y-726", not a nice smooth name like "R-100." As far as
I can tell from the tube lineup and photo, it's identical to the R-100.

BTW, does yours have the crystal calibrator? It's the leftmost or rightmost
position of the Mode knob on the far right. Like the S-meter, that was an
optional add-on. Well worth having, though on the higher bands it can be hard
to tell which harmonic of 100 KC you have! 73, Mike K.

From: m_thompson@ids.net
Message-ID: <v0f72vp1glkacb@corp.supernews.com>
Source record: 35721

I have a Hallicrafters SX-42 that needs a bandswitch. The expert that is helping me repair the set said that there are some burned but repairable parts in the band switch.

The wafer that controls the local oscillator leaks. This wafer has been externally cleaned but still causes problems.

The expert says that it is not worth the time to replace the local oscillator wafer even it I could find a replacement.

Are replacement wafers available?

Suggestions?

You might want to take a gander at Phil Nelson's article where he
encountered the same problem. Maybe you can get some ideas from it.
http://www.antiqueradio.org/halli07.htm
By the way, find a new 'expert' who isn't so landfill happy.

Hi Folks !

Im looking for the following....

front plastic case bezel for the ID-5001 weather station - in
good condition

I do have some ID-4001 parts that I can trade for the bezel too!

Better yet.... I will even buy a non working ID-5001 weather
station !

I found his article a few weeks ago. It looks like repairing the band wafer switch is possible if
I can find a donor.

My expert is being practical. He suggested that the SX-42 might not be worth the time and effort
required to replace the wafers.

In article <v0f833e821jbd3@corp.supernews.com>, don'tspamme-exray@caribe.net says...

Have any of you ever heard of a SX-100 Mark1B ??
I've owned this sx-100 for sometime and couldn't recall if it was a Mk1A or Mk2. Looking on the rear of the notch filter enclosure there's "MARK1B" printed on it. Any ideas??

Tnx de Bill

Odds of finding a good donor are probably pretty slim since this a
somewhat common problem. You might have to do the Dremel/Glue appraoch.
Of course thats even more painstaking (time=money) but if the set is
in nice condition otherwise it would be well worth the effort. Its a
great radio.

Good luck

>The expert says that it is not worth the time to replace the local oscillator >wafer even it I could find a replacement.

Your expert is not one of the experts who takes an SX-28 RF deck completely apart, one wafer at a time, to replace all the old wax firecrackers (ex-capacitors).

It's your time, and your radio, and a pretty fabulous radio at that. You make the call. Best wishes on a replacement wafer.

BTW, my own SX-42 has not been worked over yet. It copies on all bands, even picks up 10m Hams and CB with a short wire antenna, yet has nowhere near full gain. I suspect the IFs are losing much of the signal, since the front end can handle 10m and usually the entire FM band at 88-108 MC. Sooner or later I will re-cap and re-res the beast. Also BTW, my bandswitch requires a lot of jiggling to get some bands. I hope Deox-It is all it needs, and that no cantacts are burned up!

Wouldn't SX 62 parts be pretty much the same - so you might expand your junker search for the 42m to include a 62. Just a thought, I don't really know.
There are probably more surviving 62's than 42's.

Mark your calendars NOW, for Saturday, January 25, 2003.

That's when the annual CC-AWA Winter Swap Meet will take place
in Columbia, SC.

For complete details including dirving directions, just
visit the CC-AWA web page at: http://www.cc-awa.org

This will be the forth year for this event and it gets bigger
every year.

As with all CC-AWA Saturday Swap Meets,
addmission and setup is FREE.

Things will get started around 7AM and wrap up by 12NOON.
Do yourself a favor and get out of bed and get there early.
Don't waste your time by showing up at 11AM cause all you'll
see is folks packing up.

There are photos of the 2002 event on the web page.
Some really neat sets changed hands.

DON'T MISS IT.

I have 2/ HW101s and 1 HP23. No 1 has been gone through and hears and plays very well but a few stuck driver slugs need replacing ie 20 and 15 mtr. It puts out 125 watts on 40 and has new finals and many new tubes. Looks vg. No 2 looks good, hears well, and just gets about 100w out but it has not been gone through. Power supply is good. I have photo copy manual and I will throw in a green Heath hand mic. Have too many projects as usual so will let the pair go to someone who wants a nice classic station. I want $225 and I'll ship and insure them. Merry xmas-Lew K1NDV

Source record: 35740

The price is $150 plus shipping. The front panel is great, and
the unit looks all original to me. I have a manual copy I'll throw in, and
will pack it very carefully. It's the gray knob version (a bit more
in demand). It gives me 8 watts out on 40. The front panel screws (to the
cabinet) are a little loose - you may want to use larger ones, or put something
in their
holes to tighten them up a bit. It is a very nice unit.

Ditto--
I use a soft tooth brush and clean rags. Never spray onto the
surface directly. I use different strength for tough spots and
clean out the brush constantly with fresh water and clean rags.
Blot the brush first to avoid pushing wetness and soap into nooks
and crannies. You will no doubt find several layers that will
require extra elbow grease once the first yellow layer is stripped
or you will have an uneven surface. Major disassembly helps
get the hidden spots that linger.

Post Note: In a lot of these sets it is possible to remove DC from the
bandswitch in question, and use an RFC to couple the B+ and a
coupling cap to the bandswitched components. Not the best repair,
it can get a set up and running until the proper donor set is found.
I've done this on some smaller Hallicrafter sets where leaking B+
was coupling into the AVC line through leaky wafer sections.

Also, most of these sets are restored as matter of pride and love
of boatanchors--if you're paying someone to do it, or if they are doing
the repair as a "favor", then they may view doing a full repair in
a different light.

Hello
I have a FT 920 with the AM filter and FM board. The FT 920 is 100 watts HF + 6 Meters. It has a Auto tuner and the MC 100 Desk Mic. In the deal you will get the technical supplement too (AKA Service manual), as well as the owners manual. I also Have the 3 kW Roller Inductor Antenna Tuner. They are in good shape I will trade both for a FT 990 or a FT 1000. I have been using the FT 920 as a backup rig. Drop me a line so we can work out a deal.
oris@dirtball.com
I have a Icom ICR71A Shortwave receiver that I will trade for a working DX 100 and SX 300 or Hamuland HQ 110. I'm looking for a good AM Ham station. I will trade this Receiver for a good working AM station. I want both transmitterwith at least 100 watts out and receiver. I hope to find something to work with my Audio rack.
I also have a Henry Amp 2 KD 5 Desktop, (It needs a new Plate amp meter) two 3-500s 100 in will give you 1250 out, New Caps, that I will trade for a Globe King or full legal output Ham band AM transmitter. this is a pickup trade only. I will be willing to travel 100 miles from Athens GA.
I also have a Hallicrafters S 38 C Shortwave receiver. Its in great shape. It works but I have no idea what its worth. It is a old old receiver. (Make Offer)
I have a MFJ Versa Tuner II and a Roadtalker 40-channel sideband CB radio that somebody converted to 10 meters. It works quite well. I talked to a guy in South America on it. (Make Offer)
I also have a CBS 1000 transceiver. 25 MHz to 29.795 MHz. In 10 kHz steps. I got it at a hamfest in Georgia. I'll trade it for a SX 300 or NC 300 HQ 110 HQ 170 HQ 200 or similar HF receiver.
I have a Kenwood TM-2530A that I used as a 2 meter packet station. It needs a Mic and the light that lights up the liquid quartz dial. The radio works fine and is in good shape. I looking for a good AM transmitter.
I have a Kenwood TR 7850 This radio I used as the BBS access on 2 meters. It needs a Mic and needs a new lithium battery backup. I turn the radio off and back on it forgets where it was and defaults to 144.000Mhz. Other than that the radio works fine. I want a working AM transmitter.
I have a Kenwood TM 201a. I used this 2 meter radio as sat transmitter. I worked Mirror before it came down. It Needs allot of work. It needs a dial. The Freq. read out is all screwed up. This is a fixerupper. It receives fine and transmits fine. It needs a mic too I will though this in too with either one of the above 2 meter rigs
I have a Versa Tuner II 949c and a Palomar PT 340 tuner tuner that I would through in too with either one of the above 2 meter rigs. I also Have a Kenwood KDC 1011 mobile CD player that has the plugs set up for a the older fords. I will through it in too with either one of the above 2

meter rigs.
I also have a Behringer Ultra Graph Pro GEQ 3102 31 band equalizer that
I will through it in too with either one of the above 2 meter rigs.

4827. Stackable power plugs

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-12-25 01:51:14 UTC
From: Bill M <don'tspamme-exray@caribe.net>
Message-ID: <v0i3l5b0etv12f@corp.supernews.com>
Source record: 35800

I seem to recall some round 11-pin power supply plugs that served as a male connector but also on the back side was a socket for another connection. Maybe this was in some old 2-way gear?
What I'm looking for is something along this line in a standard 8-pin (octal) configuration.
Does such a thing exist and any tips on where to locate 1 or 2 of them?

TIA,
Bill WX4A

Monday, I stopped by the old National Radio plant in Malden MA (now a furniture store) to pick up a recliner. While walking through the building, I asked some of the older workers about the history of the place. Most knew that it had been a well known radio manufacturer and showed me where some of the larger rooms had been. I kept hoping to find an old HRO-500 laying around but 'no such luck'!

Have a TB6EM in very good shape. Has minor problem ie boom needs splice on reflector end. Will take offer on entire unit or sell parts and or the trap assemblies. I can ship it if necessary. Also the matching balun is not included as I don't have it anymore. This was an active antenna from sk estate. If you can pickup near Boston -price is very negotiable. Also have a 2nd TB6EM coming in warmer weather-ie its up on tower also near Boston. Merry Xmas and Happy Holidays -Lew KlNDV

I've never seen such a thing commercially made, but I've made a few of them
myself (!) for octals.

Simply find a defunct octal based tube with a nice-sized base and all the pins
you need. Smash glass, clean out all the wires, glass and gunk in typical
recycle fashion. Clean out the tube pins with a holt solder iron and flick of
the wrist.

Then find an octal tube socket that fits the scoket nicely (some prefer MIP
type with the ears ground off, while others use saddle-type without the
saddle). Then carefully drill a hole in the side of the tube base to pass the
power cable.

Wire the cable conductors to the socket pins. Also attach extra-long stiff wire
extensions to the pins so they will match up to the tube base. Use spaghetti on
the extensions (or leave some insulation) so they don't short out. Insert the
wires in the respective holes and slide the thing together. Test with ohmmeter
for shorts, then solder and trim the tube base pins. Epoxy everyhting together
for a permanent job.

A bit of work, but a nice result can be had with a bit of effort. And you can't
beat the price!

4840. Heathkit SB 230 Help with initial checks

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-12-26 01:30:10 UTC
From: GAEL79@peoplepc.com
Message-ID: <3de1a5d2.0212251730.31cd8766@posting.google.com>
Source record: 35813
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew

Hello All,

I am new to this, and this is my first Amplifier, so be gentle with me (HI-HI).

I have pieced together a Heathkit sb 230 HF Amplifier and am having proplems. I did not know the history of these parts, so I was very detail oriented (you might say anal retentive) about checking all the parts and taking several days to go through the complete assembly manual to ensure all was assembled correctly.

Here's what happened:
I am working the initial checks here, with no coax, radio, antenna, just the stand alone amp.
I am on page 88 of the assembly manual. Meter zero - GOOD. Check #1 - all GOOD. Check #2 pulled wire from pin 3, cover back on, this part goes good, hi temp light works. replaced wire on pin 3, replaced cover. Plugged in line cord. Turned amp. on. I got the delay light, and it went out within the 60-90 second window.

Turned the meter switch to exciter only. The "exciter" light works only in the exciter position, as it is supposed to.

Now is when things go wrong. I switched the meter to plate, they tell me to find a piece of "hook-up wire" to short out the relay phono socket. So, I found a wire and I am just starting to lean over the cabinet, to reach the relay socket (I never actually shorted the relay socket out), it is now 15-20 seconds after I swithed to plate, and I see a spark, through the cabinet top in the area of the relay (RY1), I blow a house circuit breaker, also the fuse in the back of the amp blew.

I must state at this point, the fuses I bought were .75 amp fuses, but not slow blow. I hope that explains my following actions.

I removed the cover, did not smell anything burnt or see any visual damage after a detailed inspection to both sides of the amp.

O.K. perhaps the fuse was faulty, I tell myself, or the fact that they call out for slow blow, and I could only find fast blow fuses in the correct amperage. Maybe the flash I saw was the relay contacts???...

I talked myself in to trying another fuse. This time It took about 5 seconds (it did not happen instantly), I had what sounded like fire crackers, and could see several sparks dancing in the rf enclosure. (I am sure it was arcing, Going on, I could see it through the top at

C15, in the rf enclosure.) Quickly, I shut off the main power switch. This time I did not blow the house circuit breaker.

Of course the fuse blew again. This time after removing the cover, I removed the RF cover to find no arcing spots on the capacitor plates (guess I am lucky). I did however, find R17, 33ohm, 1 Watt resistor blown to bits. This resistor is located just off of the grid of v1.

About the 8873 ceramic tube. The filament pins 5 and 6 show continuity. and the grid pins (4,7,11) are not shorted to the cathode pins (1,2,3,8,9,10).

Does the fact that that resister blew, and the fuses blew, mean I have high grid current? Did the arcing in the rf enclosure happen because the tube was energized, and no dummy load was connected to the amp?? Is this amp trying to amplify power, when it is not supposed to? Does the "fireworks display" in the rf enclosure at least prove the tube is good or amplifying like it is supposed to?

I have no idea what to do next. Anyone who could point me in a direction, I would be greatful.

Thank you for taking the time to read through this!!!

73,

Scott KC9AWN

P.S. I posted this on E-Ham.net a couple of days ago. The responce I got back was something about checking for para. oscillations? Could someone please explain to me?

Thanks,

Scott

4841. AM transmitter Wanted

Hello
I have a FT 920 with the AM filter and FM board. The FT 920 is 100 watts HF + 6 Meters. It has a Auto tuner and the MC 100 Desk Mic. In the deal you will get the technical supplement too (AKA Service manual), as well as the owners manual. I also Have the 3 kW Roller Inductor Antenna Tuner. They are in good shape I will trade both for a FT 990 or a FT 1000. I have been using the FT 920 as a backup rig. Drop me a line so we can work out a deal.
oris@dirtball.com
I have a Icom ICR71A Shortwave receiver that I will trade for a working DX 100 and SX 300 or Hamuland HQ 110. I'm looking for a good AM Ham station. I will trade this Receiver for a good working AM station. I want both transmitterwith at least 100 watts out and receiver. I hope to find something to work with my Audio rack.
I also have a Henry Amp 2 KD 5 Desktop, (It needs a new Plate amp meter) two 3-500s 100 in will give you 1250 out, New Caps, that I will trade for a Globe King or full legal output Ham band AM transmitter. this is a pickup trade only. I will be willing to travel 100 miles from Athens GA.
I also have a Hallicrafters S 38 C Shortwave receiver. Its in great shape. It works but I have no idea what its worth. It is a old old receiver. (Make Offer)
I have a MFJ Versa Tuner II and a Roadtalker 40-channel sideband CB radio that somebody converted to 10 meters. It works quite well. I talked to a guy in South America on it. (Make Offer)
I also have a CBS 1000 transceiver. 25 MHz to 29.795 MHz. In 10 kHz steps. I got it at a hamfest in Georgia. I'll trade it for a SX 300 or NC 300 HQ 110 HQ 170 HQ 200 or similar HF receiver.
I have a Kenwood TM-2530A that I used as a 2 meter packet station. It needs a Mic and the light that lights up the liquid quartz dial. The radio works fine and is in good shape. I looking for a good AM transmitter.
I have a Kenwood TR 7850 This radio I used as the BBS access on 2 meters. It needs a Mic and needs a new lithium battery backup. I turn the radio off and back on it forgets where it was and defaults to 144.000Mhz. Other than that the radio works fine. I want a working AM transmitter.
I have a Kenwood TM 201a. I used this 2 meter radio as sat transmitter. I worked Mirror before it came down. It Needs allot of work. It needs a dial. The Freq. read out is all screwed up. This is a fixerupper. It receives fine and transmits fine. It needs a mic too I will though this in too with either one of the above 2 meter rigs

4842. New simple LC filter design program

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-12-26 02:08:17 UTC
From: Reg Edwards <g4fgq.regp@btinternet.com>
Message-ID: <audoag$6tv$5@knossos.btinternet.com>
Source record: 35815

PROGRAM "LPF_HPF.exe"

Most filters consist of one or more cascaded, simple, 3-component, T or Pi sections and are used in a multitude of applications where pass-band ripple, frequencies of infinite attenuation in the stop-band, exact impedances matches, etc., are not of consequence.

This easy to use program calculates component values of high-pass, low-pass, T and Pi, basic filter sections. Internal filter loss is neglected. Operating inconveniences which may be present in more complicated programs can be avoided.

Filter response vs frequency is in terms of dB insertion loss between Ro terminations for 1 to 5 cascaded sections. Frequency range is from audio to VHF.

Download in a few seconds program LPF_HPF.exe from website below and run immediately.

I have one beauty of a Vintage Vibroplex Lightning Bug on Ebay.....

check it out, even if just to see the pictures !!

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=1946203920

1951 model s/n 171133

no reserve ! $9.99 starting bid

> P.S. I posted this on E-Ham.net a couple of days ago. The responce I
> got back was something about checking for para. oscillations? Could
> someone please explain to me?

Parasitic oscillations.

the fact that the grid resistor was blown to bits, indicates to me that there might have been some vhf oscillations, that probably started because the resistor had possibly changed values, or simply wasn't large enough to handle the current being drawn through it, when the amp was place in the 'operate' mode (by closing the relay).

Check out the characteristics of the 8873. You should find out what the static current would be on the grid, while voltage is applied.
Since this is grounded-grid, there won't be any bias supply, -but- the grid leak resistor will still have some voltage across it, and there will be some grid current, at rest (grounded grid amps, are still run in AB1).
Whatever that voltage is, at the amount of grid current being read, will determine how much power handling capability is required of the resistor.

Merry Christmas - hope it was good.
-Geoff

Not trying to be smart aleck, but where in the post does it say
"Hallicrafters" SX-300?

Scott,

First - tell us a little more about your amplifier. As I recall, the SB230 was introduced in 1975, and produced until the early 80's. Unless you were r-e-a-l s-l-o-w and very anal retentive, it shouldn't have taken you 20 years to assemble this Heathkit. What's the background - all new parts? Sealed box? Disassemble and rebuild from scratch?

Second, there were problems with the SB230 and self-oscillation, and during its life we included several versions of parasitic suppressors to prevent VHF self-oscillation of the tube -- resulting in the types of behavior that you describe. Depending on when your kit was manufactured, you may have an early model with a ...less-than-optimal... parasitic suppressor on the tube.

My memory is a little shaky on this - that was about 30 years ago for me. But there is a Heath mailing list and Heath reference sites on the net, with on-line technical bulletins for kits like the SB230. You should check those out before re-applying power to the SB230.

In case you hadn't noticed, the 8873 tube sells new for about $700 [it was $35 in 74 when we designed the amplifier] , rendering the amp all-but-useless in the event of a tube failure (and used 8873s are scarcer than hen's teeth). So, you should take great care when troubleshooting this problem less you blow the tube.

Is this not the 'boatanchor' forum? I would assume that everyone on here
KNOWS that SX was what Hallicrafters used for their later model radios.
Such as SX-101a/ SX-111a/ etc.

Excuse me for assuming you had any knowledge.

Have a nice day.

Dan/W4NTI

Try Mike Shelton at:

http://www.angelfire.com/nc/totalelectronics/

They have a lot of paint supplies for Collins and many other rigs.

Hi Dan,
I'm thinking he meant DX300- as this was also a Realistic RX- D and S next to each other on the keyboard. But, if there was a Hally SX-300, I'd like to learn more.

all new parts? Sealed box? Disassemble and rebuild from scratch?

I got the amp from a garage sale, in piles of parts. I am lucky
enough enough to have an old tv/ham store in town for some of the
resistors, caps etc. that were missing. I wish I new more about the
amp. but I don't. I can tell you that I went step-by-step through
every page of the manual and (NOW) it is together correctly. (I am a
Avionics Technician by trade) Whether the tube is any good is anyones
guess, but it passed the coninuity test on the heater pins, and the
grid pins are not shorted to the cathode pins. I would also assume
that the tube was good, or I would not have had the "fireworks" in the
rf enclosure.

> Second, there were problems with the SB230 and self-oscillation, and during

> early model with a ...less-than-optimal... parasitic suppressor on the tube.

Forgive my ignorance here but...

Should there be any oscillations at this point? please understand that
I have no experiance with HF amps. I had "nothing" hooked to the amp,
and am doing the initial checks. I didn't have "anything" external to
the amp hooked up. No radio, no antenna, no dummy load, nothing. Your
operators manual does not tell me to hook up anything to the amplifier
to do these initial tests. I did not even get to short out the relay
connector, per your manuals instructions, before things went bad.
> My memory is a little shaky on this - that was about 30 years ago for me.
> But there is a Heath mailing list and Heath reference sites on the net, with
> on-line technical bulletins for kits like the SB230. You should check those
> out before re-applying power to the SB230.
I have looked to no avail. A ton of information on SB200/201 and
SB220/221 and SB1000's, but no info on SB230's. If anyone knows of a
source on the net, I am all ears.

> In case you hadn't noticed, the 8873 tube sells new for about $700 [it was

> than hen's teeth).<Snip>.
Yes, I did notice that. If it gets to the point where I have to buy a new tube, I will modify the amp for a different tube and provide a blower for cooling.
>
> -larry

Excuse me there is not one of you that is perfect. Hallicrafters SX 99
was the receiver that I had in mind.I looked at the National NC 300 and
by the photos its very simalar to the SX 101a. That is where I made my
mistake. In fact I will correct my error in my next post. Thankyou for
pointing it out to me. Its been 20 years since I have been around the
old gear. :-[OPPPPPPPPPS!
Here is my post done over

Hello
I have a FT 920 with the AM filter and FM board. The FT 920 is 100 watts HF + 6 Meters. It has a Auto tuner and the MC 100 Desk Mic. In the deal you will get the technical supplement too (AKA Service manual), as well as the owners manual. I also Have the 3 kW Roller Inductor Antenna Tuner. They are in good shape I will trade both for a FT 990 or a FT 1000. I have been using the FT 920 as a backup rig. Drop me a line so we can work out a deal.
oris@dirtball.com
I have a Icom ICR71A Shortwave receiver that I will trade for a working , Viking Ranger and SX 99 or Hamuland HQ 110. I'm looking for a good AM Ham station. I will trade this Receiver for a good working AM station. I want both transmitter and receiver. I hope to find something to work with my Audio rack.
I also have a Henry Amp 2 KD 5 Desktop, (It needs a new Plate amp meter I have a meter for it just havent put it in yet.)that Ill trade. Two 3-500s 100 in will give you 1250 out, New Caps. I will trade it for a Valiant and a receiver, or full legal output Ham band AM VFO controlled transmitter. This is a pickup trade only. I will be willing to travel 100 miles from Athens GA.
I also have a Hallicrafters S 38 C Shortwave receiver. Its in great shape. It works but I have no idea what its worth. It is a old old receiver. (Make Offer)
I have a MFJ Versa Tuner II and a Roadtalker 40-channel sideband CB radio that somebody converted to 10 meters. It works quite well. I talked to a guy in South America on it. QRPuke! (Make Offer)
I also have a CBS 1000 transceiver. 25 MHz to 29.795 MHz. In 10 kHz steps. I got it at a hamfest in Georgia. I'll trade it for a SX 99 or NC 300 HQ 110 HQ 170 HQ 200 or similar HF receiver.
I have a Kenwood TM-2530A that I used as a 2 meter packet station. It needs a Mic and the light that lights up the liquid quartz dial. The radio works fine and is in good shape. I looking for a good AM transmitter. A Viking Ranger would be a fare deal.
I have a Kenwood TR 7850 This radio I used as the BBS access on 2 meters. It needs a Mic and needs a new lithium battery backup. I turn the radio off and back on it forgets where it was and defaults to 144.000Mhz. Other than that the radio works fine. I want a working AM transmitter. Something like the Viking Ranger.
I have a Kenwood TM 201a. I used this 2 meter radio as sat transmitter. I worked Mirror before it came down. It Needs allot of work. It needs a dial. The Freq. read out is all screwed up. This is a fixerupper. It receives fine and transmits fine. It needs a mic too I will though this in too with either one of the above 2 meter rigs
I have a Versa Tuner II 949c and a Palomar PT 340 tuner tuner that I

would through in too with either one of the above 2 meter rigs. I also Have a Kenwood KDC 1011 mobile CD player that has the plugs set up for a the older fords. I will through it in too with either one of the above 2 meter rigs.
I also have a Behringer Ultra Graph Pro GEQ 3102 31 band equalizer that I will through it in too with either one of the above 2 meter rigs.
Hey thanks for reading
Happy Holidays

4858. Help- Icom 720a Won't Stop Clacking

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-12-26 21:49:13 UTC
From: Richard Donahue <rdonahue10@home.com>
Message-ID: <v0mu9bju1lrfc3@corp.supernews.com>
Source record: 35831

I have an IC 720a which I installed a new power switch in and then after getting the rig put back together, it doesn't work. It powers on but the relay keeps clacking and doesn't stop. It may just be I have a connector in the wrong place or I blew something by putting a connector back into the wrong place.

Does anoyone have a suggestion I should try before selling it for parts?

Oris,
There is no need to post the same ad over and over every couple of days.
The posts remain active to a user until the server (or user) dumps
them, which could be months from now for some people.
Anybody who staggers in tomorrow will likely see all 10 or 15 that you
have posted in the last couple of weeks.

Tnx,
Bill

Did it work before you needed to replace the switch?

Perhaps it is the VOX relay clicking. Turn it out of VOX. Just a guess.

I am not familiar with the Icom rigs. Perhaps someone else can help.

These two excellent looking and performing radios are excess to my collection and needs. They are both in great cosmetic and electrical condition. Immaculate front panels and great looking cabinets.

The FT 707 is a HF xcvr with WARC coverage 100W smaller than a TS 430S. All solid state. Asking $250 plus shipping or trade for ???

The Ten Tec Triton IV is a 200W PEP solid state HF xcvr with no WARC coverage. Asking $199 obo plus shipping or tarde for ???

Looking for a FT 817, IC706MkIIG etc etc. WHat have you?

Thanks,
Tim

Looking for a schematic with parts values for this poor old radio.
Picked it up on the bay last summer and just getting to it.
First thing I found was a melted power xfrmr. However the Heath HV supply
and a signal tracer (final AF problems) it is playing----- marginally

Unfortunately non of the usual sources (nostalgia air) . BAMA have one.

Anybody have a copy?

thanks and 73

Come on know, how can I have any knowledge when you obviously have it all? Halli wasn't the only manufacturer to ever use SX. I am very familiar with the Halli line, I actually own an SR-2000, it's for sale or trade btw, and as such I assumed it was a typo and what was meant was SX-100. I was wrong. I suppose it has never occurred to you some people are here to learn about BA's and they wouldn't know the SX thing. Quick, who else used SX? 73 and 88 ;)

Only when plugged into a motherboard with 16M of memory & math co-processor, with dual 5.25" drives, 88-key KB, a 1200 baud modem and a 40 M HD, all in a full tower case. A big plus would be a wide-carriage daisy-wheel printer and an EGA monitor.

Ed

You guys talking about the little stuff.
I still have my OSI C2-8P. (Ohio Scientific)
It had a 1 MHz 6502, 48K of 61 X 1 Dynamic Ram, and *dual* 8 inch
Siemens floppies. Those 360K 8 inch floppy drives were in a 19 inch
wide X 10 inch high cabinet...I think it was about 16, or 18 inches
deep. the computer was in another cabinet the same size.

It cost me over four grand *without* a monitor or keyboard.
BTW those memory chips cost nearly $20 each.
I mounted a keyboard that used Hall Effect keys on plywood wedges and
used a 10 inch B & W security monitor. I later added a real 13 inch
monochrome monitor.

It and my Amiga 2000 are down in the basement ...somewhere.
My Amiga predated the high resolution output by only a few serial
numbers. Had it had high resolution I'd probably still be using it.

Some are better than others. Compared with my Collins R-390, the performance on MW is not so hot, but the audio quality is much better (partly because of the wider bandwidth). My father regularly uses one of the earlier Zenith sets to listen to KDKA Pittsburgh here in Virginia, but he will occasionally show up at my door demanding I turn the Collins on for him when he is having trouble getting Steelers games. This is very bad because when the Steelers are losing he will pick up random objects and throw them around while shouting, and the Steelers have been losing a lot in recent years.

Yeah, but unless he throws a handgrenade at the 390, the thing is safe.

It is kinda sad how the Steelers have sagged as of recent days.
However, I'm in Seattle and our Seahawks seem to have flown South for
the winter right from the initial game for the last, oh, 15 years....

Some of these cameras are quite valuable.
I did a search on ebay and got quite a range.
search on aerial cameras not ariel
http://search-completed.ebay.com/search/search.dll?GetResult&query=aerial+camera&from=R7&ebaytag1=ebayreg&ht=1&combine=y&st=2&SortProperty=MetaEndSort

See if what you have is in there. I do recall them being cheap after
the war, but I also recall they went up fairly high in the 90's as
collectors items.

4884. SWAN ?

Newsgroup: rec.radio.amateur.boatanchors

Hi everyone...

Hope you all had a nice holiday and Santa brought you some goodies to play with.

I have a Swan question.. Concerning the "350" series.

It is my understanding there were 3 units produced - The Swan 350, Swan 350 B, Swan 350 C.
IF this is true, where is the designator located and/or what are the differences?

"I" am not real familiar with the line and I have a friend who is in need of the information.. So, I'm trying to help him out. ANY help will be appreciated. Thank you very much in advance..... PLEASE reply directly, as I'm not always able to get the newsgroups.....Thanks.

From: Lou <tech@dp.net>
Message-ID: <auiv41$20ql$1@news.dp.net>
Source record: 35759

Any one in need of a CRT for a Tektronix scope? I have one here which was salvaged out of a scope torn apart only because I had no place to store it, could not sell it - too heavy to ship, and I have 4 more anyway of different models. The display was nice and bright, it was a dual trace scope, but one trace - due to the plug in, was not working.

The part number is: 154-0165-00 ----- It's been a while, I "think" it was a 535. I also have a few of the other parts floating around also. If you 're in need of these to refurbish, here ya go.

IF anyone is in need, I'll make a good deal.. Otherwise I'm getting rid of it.. Trying to clean stuff out.
I didn't want to post an FS here, but don't want to just pitch a CRT if it can be used by someone. And it did come from a "Boat Anchor" of a scope.....
IF this FS ticked you off, my apologies.. No flames needed.

Hi Oris,
I have a very nice DX-60B. No VFO- although there always seem to be 2 or 3 at a time on EBay.

Lou, I had a straight Swan 350 from the first years production and it was a complete dog! Neither I, nor Swan, could ever get it to stabilize. The VFO would chirp and/or jump a few KHz in frequency and drift all over. I was not the only one in the DC area to have this problem, either. Years later, I got a 350C to use as a loaner rig. It worked rather well. If your friend is bound and determined to get a Swan 350, I'd recommend that your find a nice "C" model that's been demonstrated to work properly.

Source record: 35775

There are a lot of Swans on the air that are stable. Usually the switch in the VFO compartment needs cleaning and sometimes one of the var caps trimmers in the VFO needs to be replaced to get the stability in line. The key to the radio like most tube radios of the time is to turn them on a half hour to hour before you want to use them.

Have fun I enough all the Swans I have.

the answer, Lou, as to -where- the designator is, is simple.
It's on the front panel.

350-C (as I recall, when I had one) and the "C" meant "Crystal", as
in 'solid and stable as a rock' in reference to the vfo. Perhaps, for
their time they weren't bad. But, remember - this was before the
days of these self-righteous digital read-out displays, and vfo's that
now boast (conservatively, I might add) of drift of less than 1 part in
20 million, or some such astronomical figure.

4905. Re: Heathkit SB 230 Help with initial checks

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-12-28 19:01:13 UTC
From: davearea51@aol.com
Message-ID: <20021228140113.10362.00000518@mb-ba.aol.com>
Source record: 35778

I twice owned an SB230. The first, I built myself and the second I bought to put on 6-meters, but I liked its silent operation so well, I kept it on HF. Yes, they are prone to VHF oscillation in the 60 to 80 MHz range. Heath did NOT include a parasitic supressor in the plate lead as they should have done. Consult the ARRL Handbook for a reasonable supressor. In addition, when mine did what you are describing, it arced from the 8873 anode, surface tracked on the BeO block (be careful) and to chassis. After I installed the parasitic supressor, I found the incident had also taken out the 8.2 volt/50 watt zener used to bias the tube properly (proper idling current - you can still download the 8873 characteristics from the Eimac site). I suggest you also check this zener. I replaced mine with roughly 11 to 13 forward biased 1N4005 silicon rectifier diodes which are FAR easier to get than another zener. The knee is also sharper and more stable with temperature. Other than that, the SB 230 is a good amp, just watch the grid current as this element is rated at ONLY 4-watts dissipation..

I'm curios as to the indexing used on this band switch, 30degrees or what? If the thing is just a rotary contact on a standard index, you could pull the shaft (not an easy task I realize) and use a wafer out of a number of surplus rotary switches provided the index factor is correct. Even if the wafer is smaller in diameter, the thing could be adapted. Just a thought>

That's why they were often called "Swan Three-Drifty's"!

(I had a 350C which worked well enough. Sold it ten+ years ago, but saved
the 12-volt DC supply for a future project which hasn't materialized!-)

Anybody know where I might find an on-line schematic for this power supply?
Mine is now showing no output and the OverLoad lamp is illuminated.

From: Richard <nearlynews_email@ntlworld.com>
Message-ID: <aunirs$8m6kv$1@ID-150848.news.dfncis.de>
Source record: 35646

I wonder if anyone here is ex Royal Navy and can remember this Rx and the "external" aerial switching circuit. I remember the mechanics of the aerial switching, there was lever that slotted into a groove: To select the aerial you set the lever to the left, middle or at right.

Thing is I don't understand the B40 AE input circuit entirely. Both ends of aerial input primary goes by way of coax to a plug. So, PL101 (b) goes to one side of primary, whilst PL101 (c) goes to the other side of the primary. Now, it surely must be that either (b) or (c) has to be run to "ground" otherwise there is no primary continuity. Yep, that must be correct. Probably provision was made for that in the aerial swithching unit. Or maybe one rx fed another and the primary of the last rx went to ground.

Another thing: For bands 1-3 (in C/D models) there are capacitors (27pF) from AE primary ends to ground, and also on two of the bands a 27 pF or a 22pF capaitor across the primary. What are these for? Are they to filter out VHF currents? Must be I think, because the AE primary is not a tuned circuit, and one is taking rf to ground from both ends of the AE primary.

I should think I should ground one end of primary permanenly and sould remove the capacitors. What say anyone?

Shematic at:

http://website.lineone.net/~adrian.j.reynolds/schem1.jpg

TIA.

Rich.

Go to http://www.nostalgiaair.org and click on the Rider's link.
Then search for a
Dewald 515
Federated 215
Halson 54
Hetro 293
This was a very common circuit in the US during the 30s. Often US sets
used a resistance line cord for dropping the filament voltage in lieu of
the barretter (ballast). Hence they acquired the name "Curtain Burners" !

Regards,
Bill

My fuzzy brain recalls Kenwood manufacturing some monoband all-mode VHF rigs during the late 1970's. I think there were models for six and two metres. Does anyone else remember these radios, and have pointers to any internet resources for specs, pics, etc? And do they ever come up for sale?

Dig around here. The TS-600 was for 6m and the TS-700/700A was for 2m.
http://www.eham.net/reviews/detail/1010

The 2m is pretty common. There's two of them on ebay(US) at the moment.

73,
Bill M

4932. Re: Admiraly B40: The AE input circuit.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-12-29 22:37:00 UTC
From: Richard <nearlynews_email@ntlworld.com>
Message-ID: <auntcp$8j2rq$1@ID-150848.news.dfncis.de>
Source record: 35655

For those who have an interest in the B40 rx, I received the following
in uk.radio.amateur. (I haven't worked out what it means yet).
Perhaps anyone who wants to make a comment could do so in that
NG to save duplication of discussion.

The following is from BR1617, the B40 handbook:

B40/A/B

A transmission line or low impedance aerial source, is connected to the
primary of the first RF transformer TR101 through Pins B and C of Plug
PL101. This primary has a nominal impedance of 80 ohms. These pins
are not earthed, the aerial being connected via a co-axial transmission
line of 92ohms characteristic impedance. A high impedance aerial may
be connected through Pin D of the same plug, this input feeding directly
into the secondary side of TR101 which is the grid circuit of the first
RF
amplifier (V101), tuned by the ganged variable capacitor C112, and the
associated trimmers and padders C109, C110 and C111. The RF
transformer, trimmers and padders for particular ranges are contained
in the turret. On Ranges 1, 2 and 3, C110 and C111 are omitted. Pin
A on PL101 is the earth connection.

B40C/D

These patterns are designed for HF receiver common aerial working
(c.a.w.), and for this purpose, the low impedance input circuits in
the turret are modified by the addition of capacitors on Ranges 1, 2
and 3. This in effect converts the primary of TRI01 into a pi element
to form part of a filter network, when several receivers are to be
worked from a common aerial. Thereis no provision for a high
impedance aerial.

Hope that helps a little

Chris.

There's a place here that sells generic replacements for the little dial scales. No pix on the website but they are in the brochure from Rock Sea.
http://members.aol.com/RockSeaEnt/scales/index.html

Good luck,
Bill

Hello radio land,

Looking for a very clean 75A-1 receiver.

Would prefer local pickup, I am in New England, but would ship or travel for the right unit.

Photos are a plus, clean, original units only please.

Also interested in other black crackle Collins or quality homebrew gear, working or not!

Thanks!

I doubt that.

You speak of the ALCU, now, the "Clan"... trying to make something out of nothing that was ever there in the beginning.

sounds like a democrat to me.

Are you sure you're not Bill Clinton in disguise?

Oh, wait... that "clan" reference tells me you can't be Clinton.
(that's for informing me on your race - until then, I hadn't a clue)

So, with that, Reverend Jackson, would you PLEASE crawl back under your rock and shut the !@$#% up?

If you can't get your lazy ass outta bed to make a hamfest in the early morning hours, then you'll simply miss out on what's not there for you, when you -finally- decide to wake up.

What the hell are you doing, hanging out on the street corners on a Saturday night for, in the first place?
If you're gonna drink, go in the bar. Besides, in most places, public intoxication is against the law.

You really are making this tooooo easy... and I've refrained from 'going there', but I -will- say this...

It's always been the democrats who bitch and moan about how things are so unjust and unfair to them, and they're not putting forth the effort to go do anything about it, for them selves. According to a true democrat, "SOMEONE", anyone, should be held accountable and responsible.

I defy you to find one democrat in a bunch, who would take such responsibility.

It boils down to this - If you want to make a hamfest, then you'll get up early in the morning and make the hamfest. If you're gonna go out and party all night the night before, then it's simple - you won't make the hamfest OR, you'll make the hamfest smelling like a brewery or distillery from the night before.

Here's my complaint about Saturday morning hamfests...
PLEASE make sure you take a shower and put on some CLEAN clothes before leaving the house Saturday morning!

4948. Frank Jones RX Schematic Needed

Newsgroup: rec.radio.amateur.boatanchors

Are you on xtal or VFO? If its VFO there's a ton of possibilities.
With xtal, it could be a result of poor tuning, bad xtal...maybe
cleaning the contacts in the bandswitch and osc tube socket with DeOxit
would help.

73,
Bill

I've yet to get around to ordering it, but Lindsay Publications
has reprinted the 1936 edition of Frank Jones' Radio Handbook,
selling for $19.95 US. See their website at http://www.lindsaybks.com

One of these days, I will order it. Back in 1971 when I got
interested in electronics, and ham radio, the library had an old
copy of the Radio Handbook, I think from the late fourties, and I
kept taking it out. It seemed more interesting than the editions
that came out under Bill Orr's editorship. I'm intrigued by the 1936
edition because it has a Super-gainer (a superhet with a regen detector,
or a regen detector with a converter ahead of it, depending on how
you look at it), and because it's old enough it may have some
interesting comments on the superregenerative receiver.

Source record: 35677

FS: Collins Broadcast 1 Kilowatt Modulator, from 20V transmitter. It contains the complete modulator deck, Mod transformer, extra 4-400 tubes, and choke. This would be a great start for a hombrew transmitter. It should fit in most racks with no problem. Also have schematic. Many caps and resistors have been replaced, needs little work to get operational. This was removed from an working back up transmitter and has been in storage for a few years. See pictures@

Hi
Check your contacts to the filter pcb where the rotary relay is fitted.
I had the same clacking problem, however it was the data being sent back
from the rotary relay contacts. It was corrupted due to hi resistance
joints in the rotary relay which can be fixed by adding a small current
path through all the used contacts as well as cleaning contacts with
Caig deoxit.

In your case the lead from the filter/rotary relay board may have come
adrift as it enters the CPU pcb.(due to work on the front panel)

Not at all. All of the best deals come at the end of the day when people are packing up to go home, and deciding that they don't really want to carry these huge boatanchors back with them, and are willing to dicker down to outrageously low prices.

>You old farts try and get my kids to bed early on Saturday, you think

Ive had these two pieces acouple years now. I hate to get rid of them as there my two favorite BA's but I need the room. They are in excellent shape,only the usual rub marks from where the dials turn is visible. Other then that they shine inside and out.The lettering is bright. Howard Mills restored them. Those of you who know of Howard Mills are aware that he is expensive but simply the best when it comes to Collins and they indeed look like they came off the showroom floor other then the usual where and tear from radios of this vintage. I bought them this way. If there was a filter made for the a3 it has it. I have $1600 in them.I will be happy to take a few pix to serious buyers/trader-- The 75a3 serial number is 231 and the 32v2 serial number is 1869 -For there age you wont find many in this kind of shape
----------<><
*OR Id be interested in a trade for a HF radio such as a FT1000D, MP , 9??, OR? - I'm in the Los Angeles area and picked these up in Tucson,AZ - Id hate to have to ship them, I have the 32v2 manual- buyer pays shipping.
Steve N6TT@hotmail.com

Other equipment id like to sell or trade:

HQ-180 (missing knob for clock)
SX42
EC2
SX23 or 24 cant remember
Howard
several others, I'm at my office now so cant quite remember all the model numbers. If your interested send me a email and we can go from there.....
Happy New Years to all
God Bless,
Steve

I'm getting out of tube audio and vintage ham radio (going qrp)
This is the remainder of my "stash"...at less than I paid, surely!!
I want to sell these two packages, I will NOT sell individual tubes,
and I don't have ANY other tubes for sale....please read carefully,
they're excellent packages...

Audio Package:
2- Tungsol 5881 6L6WGB used, tested
2-RCA 6L6GC (clear top) used, tested
1-Sylvania 5932 (6L6WGB) used, tested
1-EL-34 (us or british, don't know) used, tested
2-7199, tested and quiet in ST-70, RCA
3-Amperex BugleBOy EF86, new (QUAD, KNIGHT, ETC)
8-12AU7, some new, all tested, including TELEFUNKEN (2)and RCA Clear
2-12AT7 (amperex, sylvania) new
4-12BH7 (Mcintosh) 2 new, 2 used, tested
3-6CG7 (for MAC, others) NEW USA
4-6AN8 (Dyna, Heath, others) NEW USA
6-6U8/6GH8 most new, including Amperex
2-6DJ8 (Counterpoint, others) 1 is a Bugle Boy Amperex
2-6BH6 (Marantz 8B, 8)
2-6SL7WGT Micanol brown base, tested and low noise!!!(Sylvania)
2-6SL7 RCA new
2-6SN7 GE new
Spare motor and drive wheel (EXC) for Thorens TD124
a few pounds of Vintage, high end and misc audio Schematics....all
populare
vintage gear (mac, marantz, dyna, scott, fisher, too much to list)
All above sold as package ONLY...$175 shipped conus

HAM RADIO TYPES:
5-6JB6, used tested in unit, puts out full power-DRAKE
2-6HF5 NEW (SWAN)
1-6DQ5 NEW (swan cygnet and 240)
4-6146A full output in transmitter, clean, no junk (Heath, Collins many
others)
3-807 military US, good, tested
2 12BY7 new, 1 used, tested, full power (most Japanese driver)
1 NEW 6CL6 driver (Collins, others)

Whole package of Radio Types, $95 shipped conus, PACKAGE ONLY

Both packages together at same time, $235 SHIPPED CONUS
Thank you,
Walt Delesandri

The clacking is the bandswitch, stepping relay and is a normal sound for
the 720A. I'm guessing that a connection is dirty or was knocked loose
while you were working on the power switch. The stepping relay feeds
"position" information to the computer. When the computer senses that
the relay is on the right band, it stops sending stepping pulses.

You might jiggle and reseat all the connectors. If you decide to pitch
the radio, I'd go fifty bucks for it, as is.

Let's not be stubborn about this - EBay is an Auction house, period.

Several of us, skip right on by the EPay auctions, as most of the sellers
are trying to get above 'top-dollar' for that peice of gear that would
only bring 1/4 that, at a ham radio swap-fest.

Please, do not post e-pay actions under the misnomer subject of "For Sale".
It's simply a lie.

4966. Collins 32S-3 Help

Newsgroup: rec.radio.amateur.boatanchors
Date: 2002-12-31 01:51:38 UTC
From: Jos <josuha@charter.net>
Message-ID: <v11u6krckrao0d@corp.supernews.com>
Source record: 35689

Hi,
I have a Collins 32S3 that started out with low grid current and low power, then only on 3 bands, and then no grid current at all, no power out.
Now the power supply (516F) is blowing fuses. The 5r4 appears to be shorting.
Any help would be appreciated. Jos

4967. Re: Frank Jones RX Schematic Needed

I can't think of anywhere in particular, other than in his books and magazine articles. He just died a few years ago. A web search shows it was November 1995, and you can read the ARRL bulletin about it here: http://www2.arrl.org/w1aw/1995-arlx069.html
And even thirty years ago he was still writing for CQ magazine. He also had articles published in Ham Radio magazine, and 73. I don't know if he had any other calls over the years, but the most prominent was W6AJF.

He was particularly known for his VHF work. In 1961, CQ magazine published his "VHF for the Radio Amateur" which is basically construction articles. I think they were cooked up for the book, though I have only limited CQs from the 1950's to be certain. I can picture a number of articles through the sixties, where some new device would come along, (Nuvistor, bipolar transistor, and FET) and he'd have a set of converters for six meters through 432MHz on basically scraps of metal.

But every so often he would have articles about some bit of gear for the HF bands, often intriguing in some way.

But he apparently wrote quite a bit in the thirties (maybe before?) for HF, though of course at that time VHF was fairly limited. Once in the fifties he wrote an article for CQ about a "supergainer" receiver which was kind of neat; only in more recent years have I learned that his concept of a hybrid superhet/regen receiver dates from the thirties and he was well known for it. As I mentioned in another post, he started the Radio Handbook that was years later edited by Bill Orr. The 23rd edition, that came out in 1989 (I think it might have been the last edition) includes a small forward by Frank.

He was one of those who was interested in trying new things, rather than in making things look good. Kind of like Bill Hoisington, K1CLL. They were things that people could look at the articles and believe they could build them too, rather than something too slick. On the other hand, nothing of his I ever read seemed to be repetion of what others were writing and the articles certainly gave off the air that he knew what he was doing.

You're right, of course. This 'heytubeguy' entity is an internet newbie
who is simply experimenting with all the angles. Like many before him,
he will probably go away from the NGs once he learns that pissing off a
segment of potential customers is not such a smart way to market.
But he has the 'right' to do that.

Please use "FA:" when listing an auction,
i.e. FA: Radio Stuff

The gentleman's agreement to use "FA:" has been very useful
and satisfies all but a few "special" people ;-).
Kind Regards,
Dave S.

I don't want to turn this into some pissin' match, but enough is enough.

Heytubguy is no internet newbie... he's been around a year or so, that I've
been lurking in this, and other groups. He -knows- better, and is simply
doing this, to upset more people.

but, as you said, once he learns that making the people who he's trying to
target in a market upset at him, isn't going to garner him any more sales.

Yes, it's true; he's the 'right' to do that.

Happy New Year,

Hi
If I lived in USA I would have offered $50.05. Cant be too much wrong with it other than a loose connector or rotary relay contact.

If it had been sitting for a while while you were waiting for the power switch, it probably is a rotary relay contact. Contact me off line for further info.

Check carefully while you're at it.

The sockets of the 516F-2 are known to have a problem with arcing. Once there's a breakdown, it's hard to fix without replacing the socket no matter how much scraping and cleaning you do. The voltage across those pins apparently exceeds the socket's rating as it ages and it's insulating properties change. A good ceramic socket to replace it is the ideal thing to do.

Likely there are other problems as well, but don't fail to check for multiple difficulties.

That would be a C-64 with a modified kernal ROM to load the first
program from the built in 1541 disk drive instead of the cassette, and
it had no cassette port. It had a 5 inch NTSC color monitor, along with
a small audio amp and speaker. 26 pounds including the power and
keyboard cable in the accessory pouch. I have a couple in my collection
of early computers.

I am looking for service information for my Amber analyzer.. Recently the power transformer went up in smoke and I purchased a parts unit to use for repairs..
The repairs were quite successful, however I still have one persistent problem with the -10dB range and need to fix this.. The other unit may provide additional parts or I may repair it .. If anyone has a toroid for these I would be interested. I am hoping that someone out there has schematics and service manuals for this beast.. I would be happy to pay any copying charges, etc.. Amber has been out of business for a long time and Google searches turn up little information..
Thanks if u can help me..

From: oceanradio@aol.com
Message-ID: <20021231105125.11224.00000298@mb-ce.aol.com>
Source record: 35607

Liberty ships didn't have unique radio stations, as I remember. I kind of remember two kinds of installations: Mackay and RCA, but I think they were the same as the corresponding Victory and other ship installations.

It may be of interest that on Dec 18th this year I was discharged from a ship in New Orleans that is still equipped with a MF transmitter with A2 modulation. However, apparently some sticky-fingered individual removed the two 4X150 modulator tubes from the modulator. Otherwise we had all the original Mackay equipment, plus a more recent higher power HF Mackay MRU-35A.

I don't remember ever being aboard a ship that was capable of A2 on HF. The HF transmitter is normally a separate transmitter and just isn't equipped for A2. The FCC regulations of 1959 provide and require the following telegraphy classes of emission: 100-160kc: A1, 160-515 kc: A1, A2, A2a, A2b, 2065-25,000kc: A1.

Calling: distress calls (8.322) should be made on 500kc, "preferably with class A2 emission, for the distress call and distress traffic." There is an automatic MF distress generator that keys the transmitter to generate the autoalarm signal. If I remember correctly, when that equipment is activated it automatically selects A2, but I'm not certain of that.

As best I can recall, there is no requirement nor was there ever any requirement until 1999 for a ship to be capable of operating HF except for voice on 2182. In fact, I served aboard a ship not too long ago that was incapable of HF CW operation. (That is except for the lifeboat radio which transmitter on 8364; I never understood that since as far as I know, nobody was ever listening on that frequency.)

The preference for MF (and LF) for safety of ships at sea should be obvious: a strong ground wave is most likely to be received by the vehicle most able to provide relief in distress, a nearby ship at sea. For that reason, even today, MF is the preferred (and the default) mode of shipboard automatic distress calling, using digital selective calling on 2187.5. If nobody responds on that frequency the automatic equipment will try higher distress frequencies and continue calling until the call is acknowledged. (The operator can select or let the equipment use the default frequencies from among several specific distress and safety frequencies, one MF and five HF.) Of course this is not the only radio means of distress calling.

73,
John K4XC

I'm afraid all this good common sense has gone by the board.
There are no U.S. stations monitoring MF any more.
Nor is the Navy. I think you might still raise the
Cubans or the Chinese- maybe a Canadian, but that's about all.
God help your folks in that lifeboat on 8MC.
They'll only be heard if some ham happens to be tuning around.

Some genius decided that an automatic satellite system was
the way to go. New ships will probably lack normal radio entirely.
If some "important person" drowns because they couldn't keep a
lock on the sat in a typhoon, you might see some sense come
back. Until then, use "little people" will have to trust
to luck.

In the last 3 days I have received 6 emails all from ham callsigns that were infected with Klez virus and all of them had innocent looking subjects such as happy new year , cbc, cbf, etc. McAfee virus scan stopped them cold thankfully. Just be careful about any email you open and make sure you update your virus-scan programs everyweek. If you dont use virus protection software, good luck!

In my day job, I fight this stuff for a living[1]. One of the
nastier aspects of Klez and its successors is the built-in
SMTP mailer and the header-forgery engine, which sends the
worm to one or more addresses from the addressbook &/or webcache
&/or addresses from other files on the infected machine, and
which fakes the "From:" header so that the mail appears to have
come from another such address.

Hard to tell who sent it; generally the best you can do is to say
"sent from this IP number at that time on t'other day", and hope
that the sender's machine was NTP-synchronized. *sigh*

[1] Yeah, that's me: spamfighter, tweaker of filters, security
guy, writer of nastygrams, and other duties as assigned.

That one looks brand new, though, so it probably can't do much talking.

>Thanks for the link though, fascinating reading.

The thing is that the GRC-109 really never got used much. It was intended
to replace the WWII-vintage GRC-106 radio that the special forces used,
but although it had SSB and more power, it was considerably heavier and
required more power to operate. Since the special forces nets were all
CW throughout the Vietnam war, the GRC-109 was something of a step down
and nobody really liked it much.

As a consequence, there have been a lot of them showing up surplus,
or there were in the seventies and eighties. Not with too much wear
on them either, although none of the ones I have seen are as nice as the
one on Ebay. But they aren't particularly rare, and Fair Radio used to
have them all the time.

They're nice field rigs, though, but less significant as an artifact
than the GRC-106, also a lot heavier to take on camping trips. I believe
some of the special forces operations folks still train on the GRC-106,
even.

That's the famous "clack - clack" of the stepping relay , they go nuts at the slightest tap,
The bandswitch could also be acting up if the rig hasn't been used for some time.
The 720A is "use it or loose it"
The contacts must be exercised regularly to stay clean and send the proper "band selected" information to the logic circuitry as well as insert the proper components across the gen cov
Easy fix, Ill bet some guys want to steal it for $50 ....to pimp on Ebay !

SNIP>
The later models came with a factory modification that provide a positive voltage to the relay which keeps the contacts clean. Amazing that people get all excited about the stepping relay.
This is exactly what auto-tuners use, and nobody seems to mind.
You will need to clean it and the band switch contacts up, I would only recomend Cramalon D5 to do this.
Do not file the gold and silver off the contacts

> Does anoyone have a suggestion I should try before selling it for parts?
Yes, dont sell it for 'Parts"

I can fix this radio

I'm having trouble with the power supply. The 5R4 tube appears to short and
blows fuses...
I took out the rectifier (5R4 and 5U4 tubes) and it does not blow the fuse.
I assume the transformer is still good??
That the problem is oin the DC part of the power supply.
I am just touching base.
I plan on putting new electrolytics in and I believe the selenium rectifier
and diode is bad too.
I hope I'm going in the right direction.
Any source for the selenium rectifier or diodes for this?
Any thoughts or suggestions appreciated...Thanks in advance..Jos..

Jos,

Look carefully at the tube sockets. They have a tendency to develop tiny carbon trails across them, causing arcing. This may be what is causing your blown tubes.
Unfortunately, the best reccomendation is to replace the sockets with ceramic units.
See the comments at the collinsradio.org site:
<http://mailman.listserve.com/archives/collins/index.cgi?query=socket+arcing&max=20&result=normal&sort=score>

You can replace the selenium with a standard 1N4003. Use a terminal strip mounted to the hole used by the selenium rectifier.
Good Luck!

73,
Ron

Not quite true, unless you are simply talking about CW.
The MF freq of 2187.5 and others are monitored by the USCG and other stations for digital selective calling signals. Around the world, other administrations have set up their coastal stations to monitor these signals. Plus there is Navtext on 518 KHz.

MF and HF digital selective calling are required under the regulations for GMDSS for ships outside of (if I remember correctly) the A1 or coastal sailing regions. In coastal areas, monitoring for digital signals on just VHF is allowable.

Of course, I've seen many a deck officer just hit the cancel button on the GMDSS console each time a MF or HF digital selective call signal rang the alarm.

The problem with ships today isn't that they are not monitoring the required distress frequencies using good equipment, the problem IS that there is no longer anyone aboard these ships who is dedicated or adequately trained in communications techniques and technology.

Thus, thousands of accidental distress signals are constantly being sent. Last I heard, the false distress signal rate was over 98%. This adds confusion and creates the "boy who cried wolf syndrome". When a true distress GMDSS digital selective call signal is sent, it's often ignored.

Doug is correct.
In addition, however, any station providing MF radiotelephone service is supposed to be monitoring 2182 khz voice. That includes commercial and government stations. Try to get a reply when you call on 2182 however. It's very very difficult. I tried for days off the African and S. American coasts and got no reply until I was within range of Bermuda.
Years ago I had an antenna coupler fail and I jury rigged it to get across the Pacific. I tried for a couple of weeks to get a reply on 2182 from any coast station and it was when I was finally close to Diego Garcia and got a ship in the lagoon to listen on 2182 that I could prove that I had a working MF radiotelephone. (I contacted that ship on MF CW.)
The false distress call rate seems to be way down of late. But false or valid, the deck officers usually just ignore them and leave the radio officer to handle them when they next come to the bridge, next morning in some cases.

Thanks very much. The pages on the Glowbug site reminded me of Bill Orr's handbook - thanks for explaining the connection. The Glowbug site is where I found the circuit for the push-pull oscillator. I've been collecting parts for it for several weeks now.
